Settlement Agreement Report

Third Quarter July - September 2016

Prepared for the Technical Oversight Committee

January 25, 2017

Shark River Slough compliance results are published annually in this report when the final approved flow data for a federal water year (WY) are available. The WY 2016 (October 1, 2015 – September 30, 2016) results will be published at that time.

PURPOSE

The South Florida Water Management District has prepared this report to provide a quarterly update to the Everglades Technical Oversight Committee on the compliance status with total phosphorus levels or limits defined in the 1991 Settlement Agreement, entered as a Consent Decree in 1992, and modified in 1995. The areas of interest in this report include the interior marsh stations in the Arthur R. Marshall Loxahatchee National Wildlife Refuge and two discharges to Everglades National Park: inflows to Shark River Slough and inflows to Taylor Slough and Coastal Basins.

EXECUTIVE SUMMARY

This report fulfills the South Florida Water Management District's reporting requirements under the 1991 Settlement Agreement, entered as a Consent Decree in 1992 and modified in 1995, for the third quarter of 2016 (July - September 2016). Total phosphorus (TP) compliance highlights for this period are summarized below for the Arthur R. Marshall Loxahatchee National Wildlife Refuge (Refuge) and inflows to Everglades National Park (ENP) (**Table 1** and **Figure 1**):

- **Refuge:** The geometric mean TP concentrations were below the long-term levels for July, August, and September 2016.
- **Shark River Slough:** The provisional results shown are based upon provisional data and two calculation methods to bracket results. These methods currently indicate provisional 12-month flow-weighted mean TP concentrations were below the 12-month long-term limit during the federal water year, WY2016.
- **Taylor Slough and Coastal Basins:** The 12-month flow-weighted mean TP concentrations were below the 12-month long-term limit during the federal water year, WY 2016.

Table 1. Third quarter 2016 TP compliance for the Refuge and Taylor Slough and Coastal Basins. Provisional third quarter 2016 calculation results for Shark River Slough.

- ppb = parts per billion. Values are actually in μg/L (micrograms per liter), which, for the purposes of this report, is equivalent to ppb.
- feet NGVD29 = elevation in feet relative to the National Geodetic Vertical Datum of 1929.
- kac-ft = thousand acre-feet.
- Compliance for inflows to ENP (Shark River Slough, and Taylor Slough and Coastal Basins) is evaluated annually based on the 12-month flow-weighted mean TP concentration for the federal water year ending on September 30.
- Shark River Slough PROVISIONAL RESULTS: Method 1 (left values) computed as S12s+(S333-S334) and Method 2 (right values) computed as S12s+(S333-S334)+S355A+S355B+S356 using all flow and TP grabs on bi-weekly compliance sampling dates.

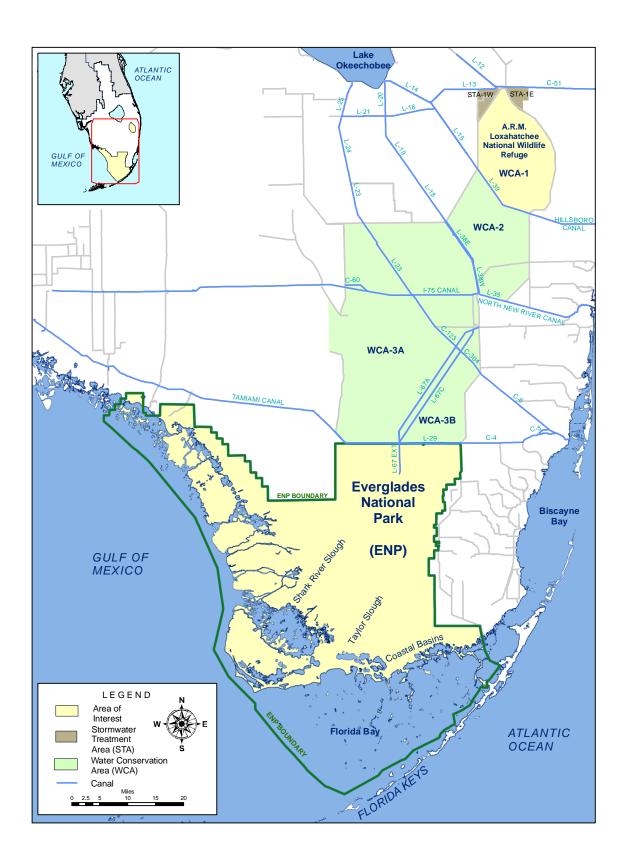

Figure 1. Areas of interest.

ARTHUR R. MARSHALL LOXAHATCHEE NATIONAL WILDLIFE REFUGE

Background

The 1991 Settlement Agreement ended the Everglades lawsuit and was entered into by the federal government, the State of Florida, and the South Florida Water Management District. The subsequent Consent Decree, as modified in 1995, specified that interim and long-term TP concentration levels for the Refuge must be met by February 1, 1999, and December 31, 2006, respectively. Both the interim and long-term concentration levels vary monthly because they are calculated as a function of water stage measured at gaging stations 1-7, 1-8C, and 1-9 within the Refuge. The stage range within which the interim and long-term concentration levels are applicable is 15.42 to 17.14 feet relative to the National Geodetic Vertical Datum of 1929 (NGVD29). The monthly TP concentrations are determined from water samples collected at 14 interior marsh stations, LOX3 through LOX16 (**Figure 2**). As required in the Consent Decree, the concentrations are converted to a geometric mean, which is compared to the long-term concentration level. Monthly TP data for each station for the past 36 months are provided in **Appendix A**. The calculation methods specified in the Consent Decree are provided in **Appendix D**.

Reporting Period Update

The number of stations sampled during the reporting period were as follows: 13 stations in July 2016, 6 stations in August 2016, and all 14 stations in September 2016. TP samples were not collected at LOX16 in July 2016 and at LOX3 to LOX10 stations in August 2016 because the water depth was less than 0.1 meter at those stations.

Sampling day average stages in the Refuge were 16.07, 15.92, and 16.62 feet NGVD29 in July, August, and September 2016, respectively (**Figure 3** and **Table 2**). The geometric means calculated from TP concentrations measured in water samples collected in July, August, and September 2016, were 7.1, 6.6, and 7.3 parts per billion (ppb), respectively. The geometric mean TP concentrations were below the long-term level for July, August, and September 2016.

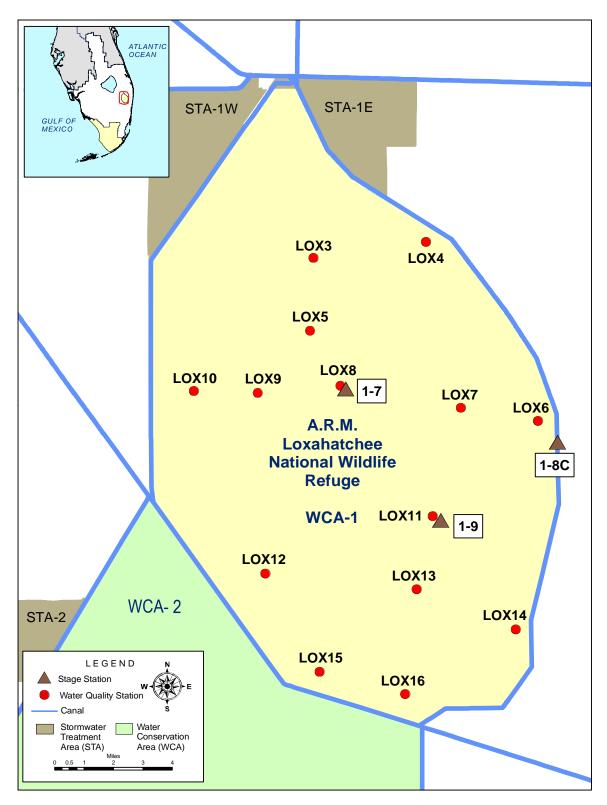

Figure 2. Refuge water quality sampling and stage measurement stations.

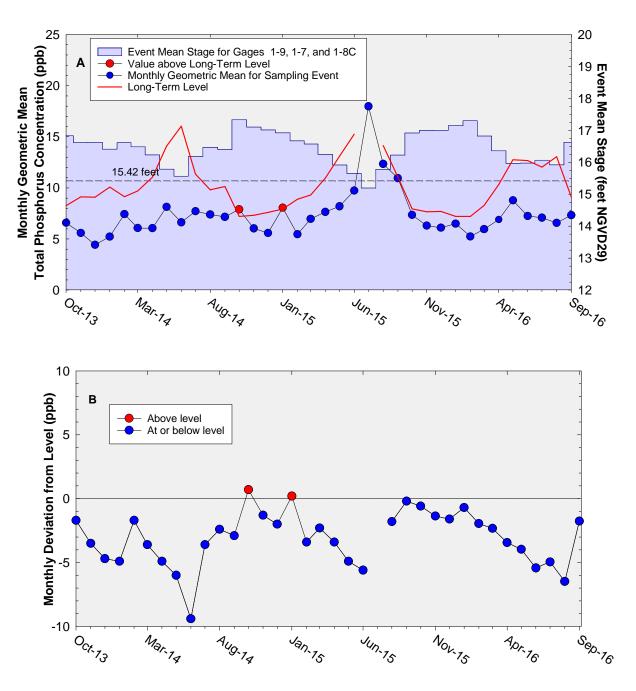

Figure 3. (A) Monthly TP geometric mean concentrations for the Refuge compared to calculated long-term levels, which are adjusted for fluctuations in stage. The geometric mean TP concentrations were above the long-term level in October 2014 and January 2015. The long-term level was not applicable for July 2015 because the sampling event average stage was less than 15.42 feet NGVD29. **(B)** Deviation of monthly geometric mean TP concentrations from calculated long-term levels. Negative values indicate that the geometric mean was lower than the long-term level.

The Everglades Technical Oversight Committee reached a consensus at the October 27, 2015, quarterly meeting on a recommendation that no additional remedies are needed at this time to address the two Refuge excursions that occurred in October 2014 and January 2015.

Table 2. Refuge TP compliance tracking.

Month	Geometric Mean TP Concentration (ppb)	Long-Term Level (ppb) Effective 12/31/2006	Average Stage ^a (ft NGVD29)	Number of Samples

- ppb = parts per billion. Values are actually in μg/L (micrograms per liter), which, for the purposes of this report, is equivalent to ppb.
- feet NGVD29 = elevation in feet relative to the National Geodetic Vertical Datum of 1929.
- Highlighted rows with bold, italicized text indicate when an excursion over the long-term level occurred.
- a. Average stage is calculated using stage elevations at stations 1-7, 1-8C, and 1-9 for a given sampling date.
- b. 1-9 gage stage datum for October 22, 2013, sampling event was missing and the October 23, 2013, stage datum at 1-9 was used for the daily stage for both October 22 and 23, 2013, to calculate the sampling event mean stage in previous reports. The datum became available on October 20, 2014, and was subsequently evaluated. The inclusion of this datum did not result in any change to the previously reported average stage calculation.
- c. December 2015 values for Refuge including resampled data (at LOX14 and LOX15) are presented in parentheses.

EVERGLADES NATIONAL PARK

Shark River Slough

Background

The Settlement Agreement/Consent Decree (1995) specified that interim and long-term TP concentration limits for discharges into ENP (**Figure 4**) through Shark River Slough be met by October 1, 2003, and December 31, 2006, respectively. It was specified that the TP concentrations be presented as 12-month flow-weighted means. Only the TP concentrations for the water year ending September 30 are evaluated for compliance with the Consent Decree limits (**Appendix D**). The long-term TP concentration limit for inflows to Shark River Slough is represented by concentrations delivered through S12A, S12B, S12C, and S12D during the Outstanding Florida Waters baseline period of March 1, 1978, to March 1, 1979, and is adjusted for variations in flow. Inflow concentrations of TP through S12A, S12B, S12C, S12D, and S333 are compared to the interim and long-term limits at the end of each water year (October 1 through September 30). The long-term limit went into effect in WY 2007.

The 12-month flow-weighted mean TP concentration (annual compliance result) will be published at a later date when the final approved flow data are available for the federal water year, WY 2016 (October 1, 2015 – September 30, 2016).

Reporting Period Update

Pursuant to agreement among all Everglades Technical Oversight Committee (TOC) members at the May 14, 2013, TOC meeting, the following three changes were made to the quarterly Settlement Agreement Report: 1) publishing of the quarterly 12-month flow-weighted mean TP concentrations for Shark River Slough is discontinued, 2) provisional quarterly 12-month flow-weighted mean TP concentrations are posted separately to the TOC website, http://www.sfwmd.gov/toc, and 3) the annual 12-month flow-weighted mean TP concentration for the water year ending on September 30 will be published once the final approved flow data for the S12A, S12B, S12C, and S12D structures becomes available. These changes have been implemented beginning with the January – March 2013 first quarter report.

The water year 2016 began on October 1, 2015, and ended on September 30, 2016. It is anticipated that the final approved flow data for the water year will be available in April 2017, and the annual 12-month flow-weighted mean TP concentration to determine compliance with the long-term limit will be published as a revision to the July – September 2016 third quarter report.

In addition to the provisional quarterly 12-month flow-weighted mean TP concentrations that are posted separately to the TOC website, the water quality data for Shark River Slough are available in **Appendix B** of this report.

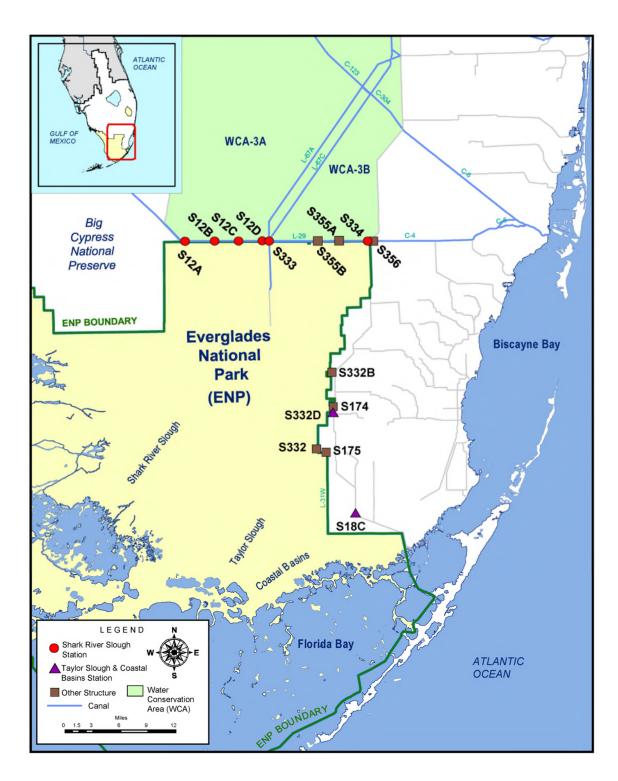

Figure 4. ENP flow structures.

Taylor Slough and Coastal Basins

Background

Under the Consent Decree, a single TP long-term limit of 11 ppb, to be met by December 31, 2006, was set for the two points of inflow to Taylor Slough (S332 and S175) and the inflow point to Coastal Basins (S18C) (see **Appendix C**). The 12-month flow-weighted mean concentrations have consistently been lower than the long-term limit of 11 ppb.

Inflow TP concentrations to ENP through Taylor Slough and Coastal Basins are compared to the 11 ppb limit at the end of each water year using data from both the old (S175, S332, and S18C) and new (S174, S332D, and S18C) combinations of structures (**Figure 5**). The narrow bars in **Figure 5** represent the 12-month flow-weighted mean TP concentrations from S332, S175, and S18C for WY 1991 through WY 2002. The wider bars for WY 1999 through WY 2015 represent the new combination of structures.

TP and flow data from both sets of structures presented in prior editions of this report through December 2001 (April 2002 report) showed that, beginning in October 2000, the 12-month moving total flow for S332D, S174, and S18C was consistently greater than flow at S332, S175, and S18C. There was also a shift in flow-weighted mean TP concentration data whereby S332D, S174, and S18C concentrations became equal to, and then consistently lower than, the concentrations at S332, S175, and S18C. These changes reflected the switch from S332 to S332D for water delivery to Taylor Slough between July 3 and July 5, 2000. Furthermore, the S174 site was plugged in September 2007, preventing any additional flow. Consequently, for WY 2002 through WY 2007, compliance tracking was represented by S332D, S174, and S18C. Since WY 2008, S332D and S18C have represented the compliance tracking structures.

The 12-month flow-weighted mean TP concentration (5.3 ppb) was lower than the long-term limit (11.0 ppb) for the 12-month period ending on September 30, 2016. Therefore, inflows to Taylor Slough and Coastal Basins met the TP limit for WY 2016 (October 1, 2015 – September 30, 2016).

Reporting Period Update

Figure 6 presents the 12-month and individual sampling event flow-weighted mean TP concentrations at the S332D and S18C structures. All TP grab sample concentrations taken on positive flow days reported for surface water monitoring at the sites were used for the compliance calculations.

The daily flows into ENP through S332D and S18C are presented in **Figures 7** and **8**. For the combined flow through S332D and S18C, the 12-month flow-weighted mean TP concentrations for the periods ending July, August, and September 2016, were 5.2, 5.2, and 5.3 ppb, respectively (**Table 3**).

The Consent Decree stipulates that the percent of flow-weighted mean TP concentrations greater than 10 ppb from each sampling event in any 12-month period must not exceed a fixed guideline of 53.1 percent. For the 12-month periods ending July, August, and September 2016, there was no sampling event TP concentration greater than 10 ppb.

Figure 9 shows the relationship between the daily inflows and the corresponding flow-weighted mean TP concentrations for each sampling event. The sampling event flow-weighted mean concentrations generally remained very low. The average of the sampling event flow-weighted mean TP concentrations was 5.0 ppb in the third quarter.

The United States Army Corps of Engineers authorized the C-111 Spreader Canal project in 1995 to restore more natural hydrologic conditions in Taylor Slough and to maintain flood protection to the east of the L-31N and C-111 canals. The original project facilities consisted of pump stations (S332B, S332C, and S332D), detention cells (Cell 1 through Cell 5), a connector cell between Cell 2 and Cell 3, a flow-way cell originating at Berm 3 of Cell 5, and four diversion structures (DS1 through DS4). Upon completion of a United States Army Corps of Engineers construction project in 2009, an interconnected detention system now exists starting at the S332B west discharge and continuing to the S332D high head cell.

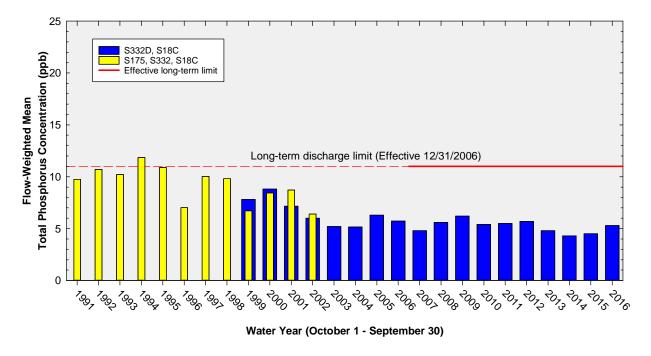

Figure 5. The 12-month flow-weighted mean TP concentrations in inflows to ENP through Taylor Slough and Coastal Basins at the end of each water year compared to the 11 ppb long-term TP limit. Blue bars show S332D, S174, and S18C for WY 1999 through WY 2007, and S332D and S18C from WY 2008 to WY 2016.

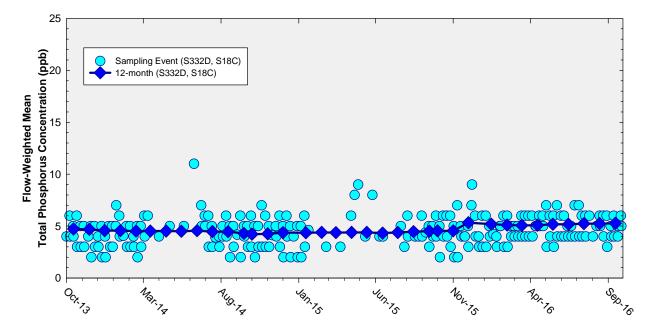

Figure 6. The 12-month flow-weighted mean TP concentrations in inflows to ENP through Taylor Slough and Coastal Basins at the end of each month and the flow-weighted mean TP concentration for each sampling event.

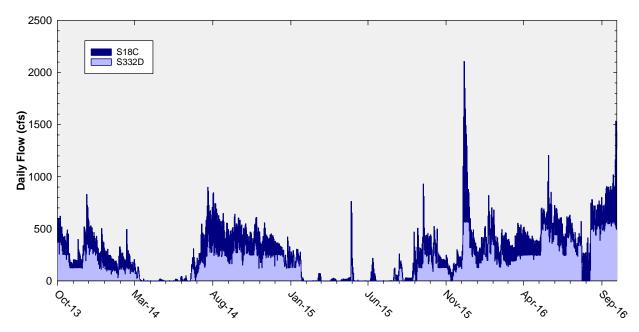

Figure 7. Daily flows measured in cubic feet per second (cfs) into ENP as a stacked sum of Taylor Slough (structure S332D) and Coastal Basins (structure S18C).

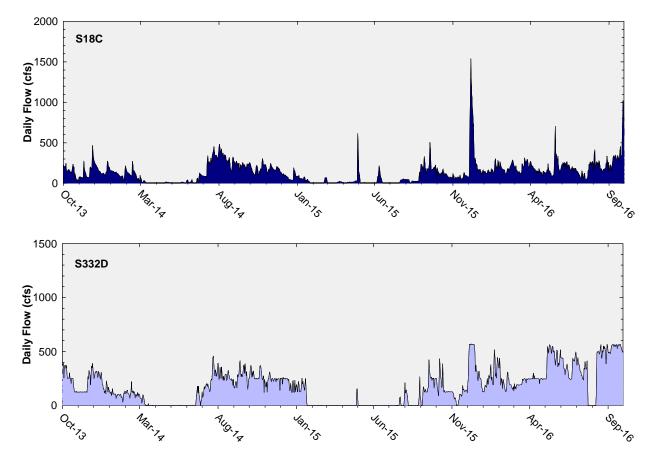

Figure 8. Daily flows at individual Coastal Basins (S18C) and Taylor Slough (S332D) structures into ENP.

⁻⁻⁻ indicates sample was not collected due to insufficient water depth.

⁺⁺ indicates the sampling trip was suspended due to low stage, following the guidance for suspending marsh sampling. (See page 3 for detail.)

⁽⁾ LOX14 and LOX15 water quality samples taken on December 2, 2015, were discarded due to processing errors and resampled on December 3, 2015.

APPENDIX B

WEEKLY GRAB TOTAL PHOSPHORUS CONCENTRATION DATA FOR SHARK RIVER SLOUGH

Total phosphorus concentration data used in this report can be directly retrieved from the South Florida Water Management District DBHYDRO database by copying and pasting the following link into the address field of a web browser:

http://my.sfwmd.gov/dbhydroplsql/water_quality_data.report_full?v_where_clause=where+station_id+in+('S12A','S12B','S12C','S12D','S333','S355A','S355B','S356-

334')+and+test_number+=+25+and+collect_method+=+'G'+and+date_collected+>=+'01-JUL-2016'+and+date_collected+<+'01-OCT-

2016'+and+sample_type_new+=+'SAMP'&v_target_code=file_csv

The link only generates data that have not been qualified. Qualified water quality data must be retrieved interactively via the DBHYDRO browser.

The provisional daily mean flow data for stations S12A, S12B, S12C, S12D, S355A, S355B, S355B Temporary Pumps, and S356 and the "Preferred DBKEY" daily mean flow data for stations S333 and S334, during the reporting quarter can be retrieved by copying and pasting the following link into the address field of a web browser:

http://my.sfwmd.gov/dbhydroplsql/web_io.report_process?v_period=uspec&v_start_date=2 0160701&v_end_date=20160930&v_report_type=format7&v_target_code=file_csv&v_run_mod e=onLine&v_js_flag=Y&v_dbkey= 03620/03626/03632/03638/MQ895/MQ896/AM173/64136/15042/FB752

The "Preferred DBKEY" daily mean flow data for S12A, S12B, S12C, and S12D structures will be available for retrieval upon completion of the final approved flow data (expected each April).

Table B-1. Weekly grab TP data (parts per billion) for Shark River Slough.

			<u> </u>		·	·			

⁻⁻⁻ indicates water sample was not collected. "Compliance date" indicates biweekly sampling date for Consent Decree calculation.

[&]quot;N/A" indicates sampling data presented for informational purposes only.

APPENDIX C

WEEKLY GRAB TOTAL PHOSPHORUS CONCENTRATION DATA FOR TAYLOR SLOUGH AND COASTAL BASINS

Total phosphorus concentration data used in this report can be directly retrieved from the South Florida Water Management District DBHYDRO database by copying and pasting the following link into the address field of a web browser:

http://my.sfwmd.gov/dbhydroplsql/water_quality_data.report_full?v_where_clause=where+ station_id+in+('S332DX','S18C')+and+test_number+=+25+and+collect_method+=+'G'+and+date_collected+>=+'01-JUL-2016'+and+date_collected+<+'01-OCT-2016'+and+sample_type_new+=+'SAMP'&v_target_code=file_csv

The link only generates data that have not been qualified. Qualified water quality data must be retrieved interactively via the DBHYDRO browser.

The "Preferred DBKEY" daily mean flow data for stations at Taylor Slough (S332D) and the Coastal Basins (S18C) during the reporting quarter can be retrieved by copying and pasting the following link into the address field of a web browser:

http://my.sfwmd.gov/dbhydroplsql/web_io.report_process?v_period=uspec&v_start_date=2 0160701&v_end_date=20160930&v_report_type=format7&v_target_code=file_csv&v_run_mod e=onLine&v_js_flag=Y&v_dbkey=15760/TA413

APPENDIX D

CALCULATION METHODS

Long Term Marsh Concentration Levels for Loxahatchee National Wildlife Refuge

Long Term Marsh Concentration Levels:

$$C = 10.7172 - 0.541156S + 1.372\sqrt{7.5819 - 0.9310S + 0.02902216S^2}$$

Terms:

C = the natural log of the geometric mean total phosphorus concentration across 14 marsh stations

S = average stage measured at gauges CA1-9, CA1-7, and CA1-8C on sampling date (feet).

This equation is applicable over a stage range of 15.42 to 17.14 feet. If the stage on any sampling date exceeds 17.14 feet, a stage of 17.14 feet should be used in calculating the long term concentration levels. The equation shall not apply to dates when the average stage is less than 15.42 feet.

(1991 Settlement Agreement entered as a Consent Decree in 1992 and modified in 1995, Exhibit B, Appendix B, Attachment II, page B-7)

Discharge Limits and OFW Standards for Shark River Slough

Interim Discharge Limit:

$$C = 11.16 - 0.00465Q + 1.397\sqrt{6.377 - 0.00591Q + 0.00000436Q^2}$$

Long-Term Discharge Limit & OFW Standard:

$$C = 11.38 - 0.00538Q + 1.397\sqrt{2.493 - 0.00231Q + 0.00000170Q^2}$$

Frequency Exceedance:

$$F = 48.411 - 0.02896Q + 1.397\sqrt{330.1 - 0.3071Q + 0.0002254Q^2}$$

Terms:

Water Year = October through September

Q = total inflow to Shark River Slough for water year, S-12s + S-333 + any additional inflow from the WCAs established in the future, thousand acre-ft/yr (Kac-ft/yr).

C = limit on maximum flow-weighted-mean inflow concentration for any Water Year, composite of all inflows to Shark Slough (ppb).

F = exceedance for maximum frequency (percent) of inflow concentrations exceeding 10 ppb, computed from the time series of concentrations composited across all inflow structures on each sampling date with positive flow in a given Water Year.

The range of flow (Q) used in deriving the limits is 117 to 1061 Kac-ft/yr. If the total flow for any water year exceeds 1061 Kac-ft/yr, a flow of 1061 Kac-ft/yr should be used in calculating the discharge limits.

(1991 Settlement Agreement entered as a Consent Decree in 1992 and modified in 1995, Exhibit B, Appendix A, Attachment I, page A-5)

Note: Technical Oversight Committee members agreed to the set of inflow structures used to determine the phosphorus limits for the inflows to Shark River Slough in March 16, 1999, and May 25, 1999, meetings. The combined flows and loads of the S-12s shall be added to the flows and loads of S-333, S355A and B, minus the flow and load discharged from S-334, to determine the Shark River Slough limits.

Discharge Limits and OFW Standards for Taylor Slough and Coastal Basins

Long-Term Flow-Weighted Discharge Limit & OFW Standard = 11.0 ppb

Frequency Exceedance:

Frequency of values > 10 ppb must be less than 53.1%.

Terms:

Limits are defined on a Water Year basis, October through September.

Basin flow is the total flow through structures S-332, S-175, S-18C, plus any new release points from this basin established in the future, thousand acre-ft/yr (Kac-ft/yr).

Limits apply to the flow-weighted-mean concentration for any Water Year, composite of all inflows to Taylor Slough (S-332) and Coastal Basin (S-18C).

Frequency exceedance is the exceedance for maximum frequency (percent) of inflow concentrations exceeding 10 ppb, computed from the time series of concentrations composited across all inflow structures on each sampling date with positive flow in a given Water Year.

(1991 Settlement Agreement entered as a Consent Decree in 1992 and modified in 1995, Exhibit B, Appendix A, Attachment II, page A-6)
