

# Florida Power and Light Turkey Point Monitoring

Data Usability Report

**Posted April 6, 2011**

**Download** 

Download a .pdf file containing the Data Usability Report for the results of the September 2010 quarterly water chemistry sampling event.

Tritium is one of the parameters being measured as a potential tracer for identifying contributions of the cooling canal system water as a source of ground water or surface water occurrences. The Florida Department of Environmental Protection drinking water standard for concentrations of tritium in groundwater is 20,000 pCi/L. All measured concentrations of tritium collected and reported herein are well below this regulatory standard used for identifying the potential for human health risks.
