

# Summary

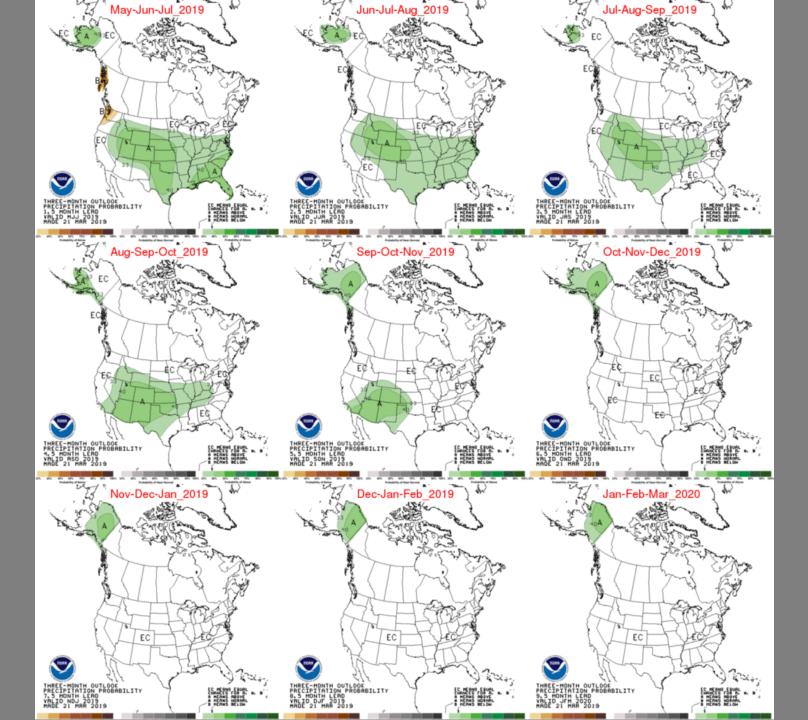

- The Climate Prediction Center (CPC) is forecasting <u>above</u> normal rainfall for April through June.
- Weak El Niño conditions are likely to continue through the spring 2019 (~80% chance) and summer (~60% chance). El Niño increases the chances of a wetter-thannormal dry season and decreases the potential for tropical storm activity from the Main Development Region in the Atlantic Ocean.
- Monitoring Atlantic Multidecadal Oscillation (AMO) index for switch to negative (cold) phase, this has the potential to contribute to drier-than-normal wet seasons.

## U. S. Seasonal Outlooks

April-June 2019

The seasonal outlooks combine the effects of long-term trends, soil moisture, and, when appropriate, ENSO.

# **Teleconnections to South Florida**

Climate anomalies being related to each other at large distances:

#### El Niño Southern Oscillation (ENSO)

South Florida dry season (November through May) rainfall is positively correlated with El Niño which has a frequency that ranges between 3 to 7 years while rainfall is negatively correlated with La Niña November through March with a potential increase in tropical rainfall during La Niña

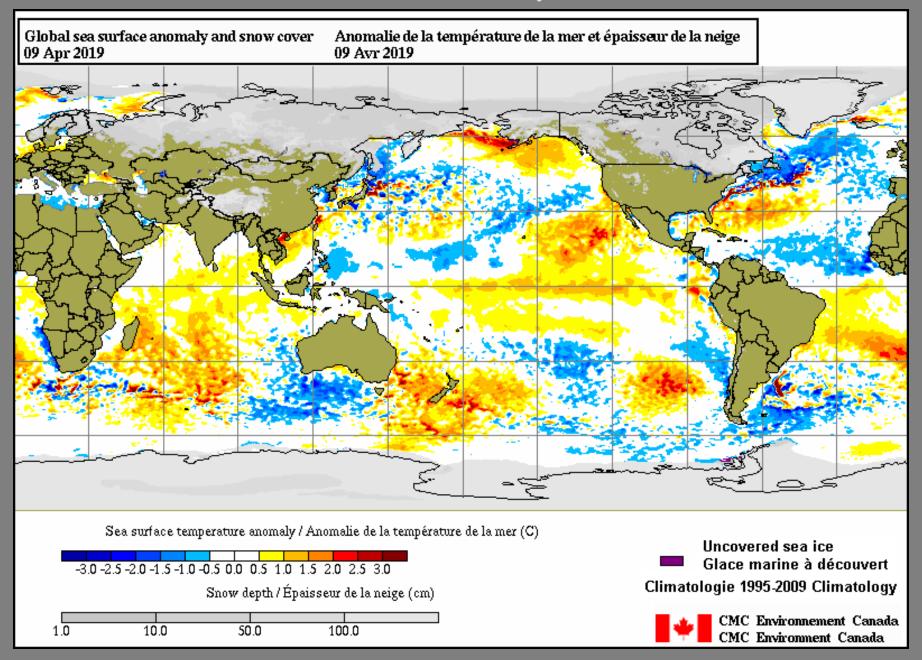

#### **Atlantic Multidecadal Oscillation (AMO)**

Average annual inflow to Lake Okeechobee is nearly 50% greater during the warm phase compared to the cold phase of the AMO, easterly flow toward south Florida affected by phase

### Pacific Decadal Oscillation (PDO)

Increases variations of south Florida dry season rainfall

## **Current Global Sea Surface Temperature Anomalies**

# Niño Region SST Departures (°C) Recent Evolution

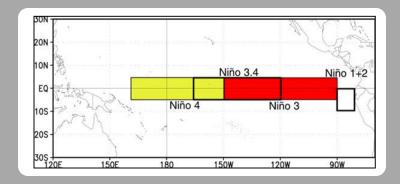

# The latest weekly SST departures are:

 Niño 4
 0.8°C

 Niño 3.4
 0.9°C

 Niño 3
 0.8°C

 Niño 1+2
 0.0°C

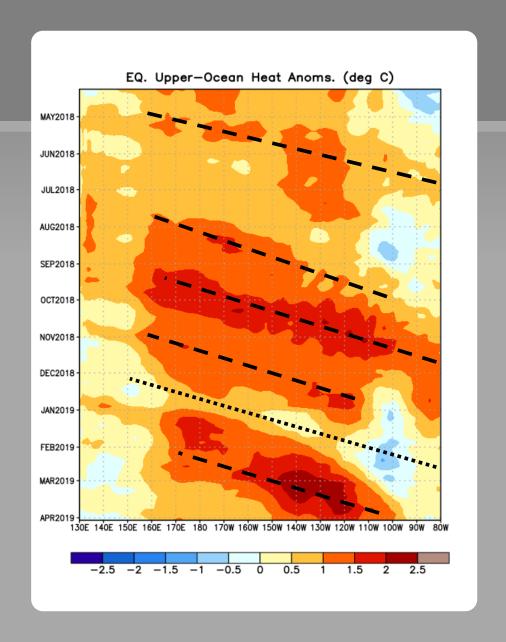

# Weekly Heat Content Evolution in the Equatorial Pacific

In early August, October, and November 2018, positive subsurface temperature anomalies increased, partly due to downwelling Kelvin waves.

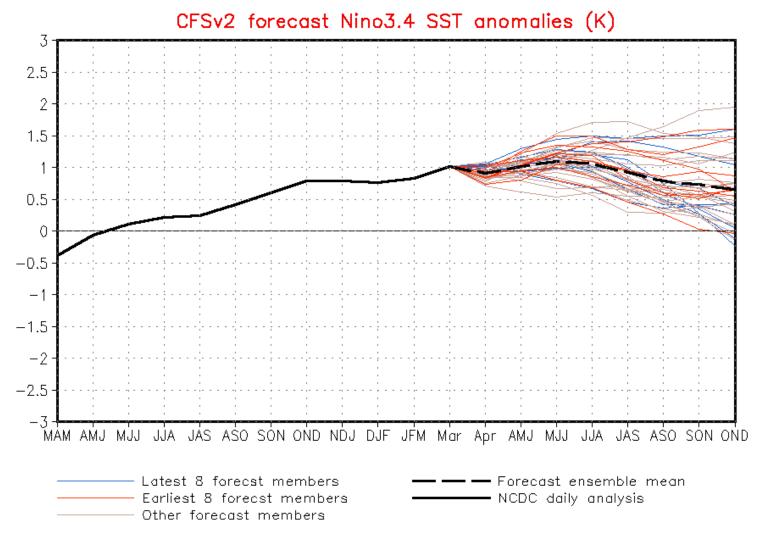

Since early January 2019, a downwelling Kelvin wave increased the positive subsurface temperature anomalies across the Pacific.

In the last couple of weeks, positive subsurface temperature anomalies have increased in the eastern Pacific.

Equatorial oceanic Kelvin waves have alternating warm and cold phases. The warm phase is indicated by dashed lines. Downwelling and warming occur in the leading portion of a Kelvin wave, and up-welling and cooling occur in the trailing portion.

# IRI/CPC Pacific Niño 3.4 SST Model Outlook

The majority of models predict a weak El Niño to continue into the Northern Hemisphere fall 2019.

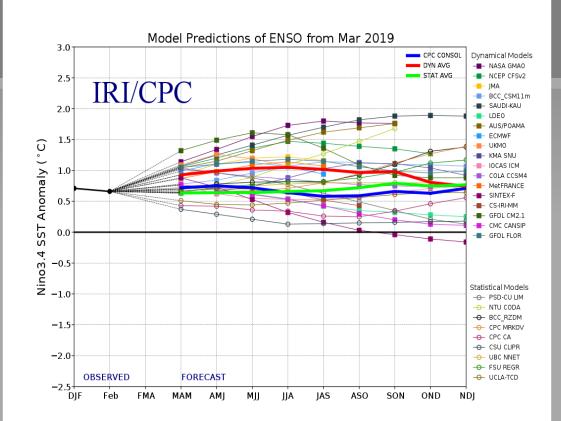

Figure provided by the International Research Institute (IRI) for Climate and Society (updated 19 March 2019).

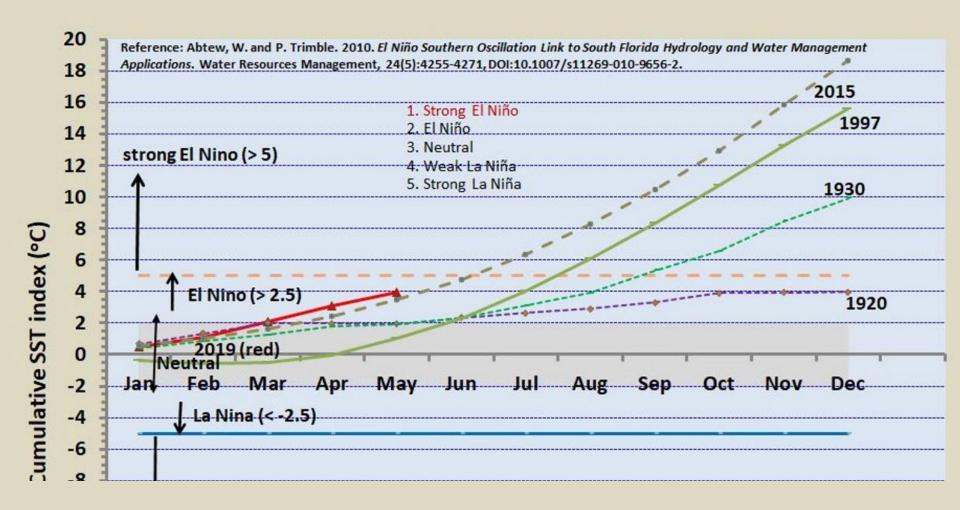

# Historical El Niño and La Niña Episodes Based on the ONI computed using ERSST.v5

Recent Pacific warm (red) and cold (blue) periods based on a threshold of +/- 0.5 °C for the Oceanic Nino Index (ONI) [3 month running mean of ERSST.v5 SST anomalies in the Nino 3.4 region (5N-5S, 120-170W)]. For historical purposes, periods of below and above normal SSTs are colored in blue and red when the threshold is met for a minimum of 5 consecutive over-lapping seasons.

The ONI is one measure of the El Niño-Southern Oscillation, and other indices can confirm whether features consistent with a coupled ocean-atmosphere phenomenon accompanied these periods. The complete table going back to DJF 1950 can be found <a href="https://example.com/here">here</a>.

## El Niño Southern Oscillation Weekly Tracking

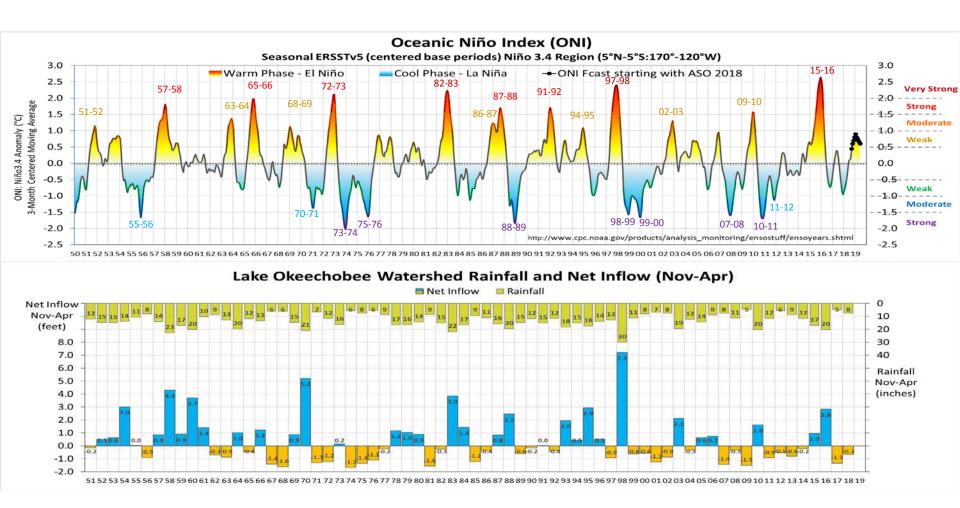

## CPC/IRI Probabilistic ENSO Outlook

Updated: 14 March 2019

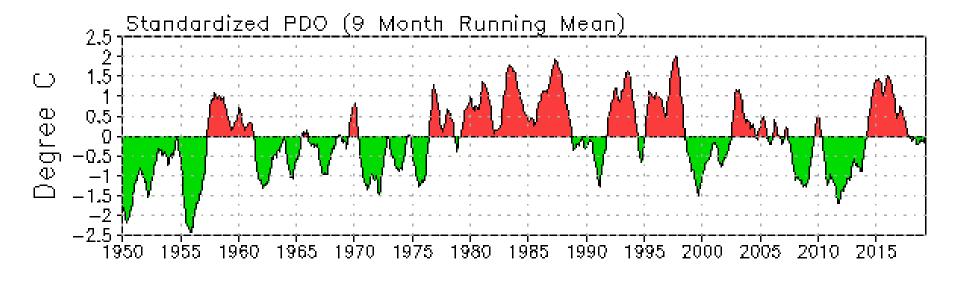

El Niño conditions are favored to continue through fall 2019 with diminishing chances (~50% in October-November-December).
