

Summary

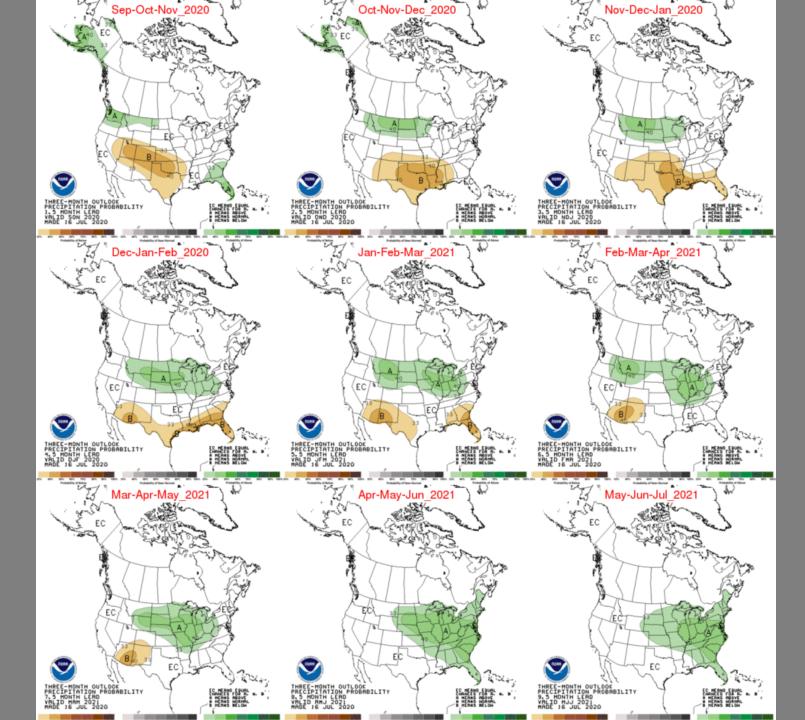

- The Climate Prediction Center (CPC) is forecasting <u>above normal</u> rainfall from August through October.
- ENSO-neutral conditions are present and favored through summer 2020 with a 50-55% chance of La Niña development during fall 2020 and continuing through winter 2020-21 (~50% chance).
- <u>El Niño</u> increases the chances of a <u>wetter-than-normal dry season</u> and decreased tropical activity, <u>La Niña</u> increases the chances of a <u>drier-than-normal dry season and increased tropical activity</u> (both have most influence November through March).
- Monitoring Atlantic Multidecadal Oscillation (AMO) which is currently in the warm phase:
 - Average annual inflow to Lake Okeechobee is nearly 50% greater during the warm phase compared to the cold phase

U. S. Seasonal Outlooks

August-October 2020

The seasonal outlooks combine the effects of long-term trends, soil moisture, and, when appropriate, ENSO.

Teleconnections to South Florida

Climate anomalies being related to each other at large distances:

El Niño Southern Oscillation (ENSO)

South Florida dry season (November through May) rainfall is positively correlated with El Niño which has a frequency that ranges between 3 to 7 years while rainfall is negatively correlated with La Niña November through March with a potential increase in tropical rainfall during La Niña

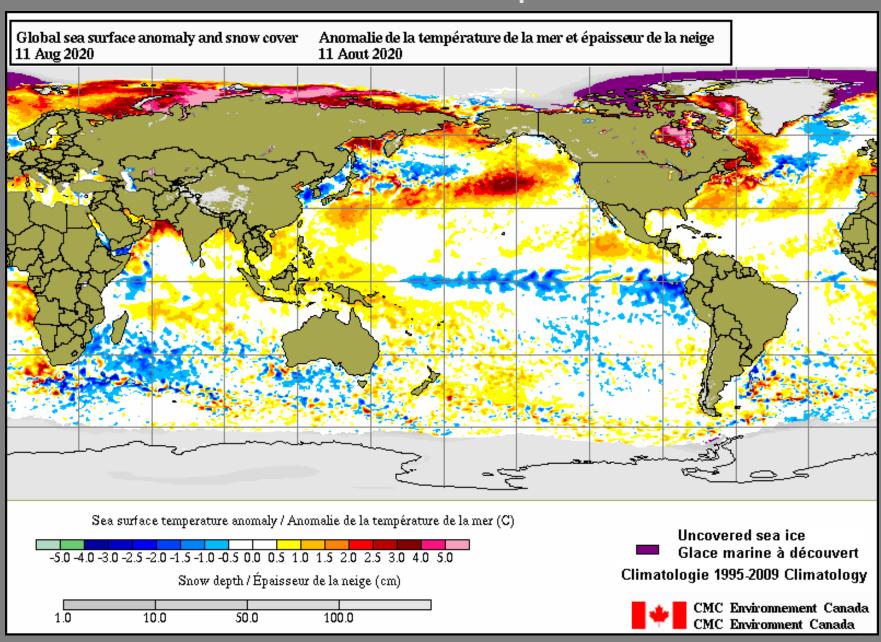

Atlantic Multidecadal Oscillation (AMO)

Average annual inflow to Lake Okeechobee is nearly 50% greater during the warm phase compared to the cold phase of the AMO, easterly flow toward south Florida affected by phase

Pacific Decadal Oscillation (PDO)

Increases variations of south Florida dry season rainfall

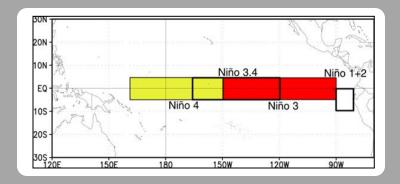

Current Global Sea Surface Temperature Anomalies

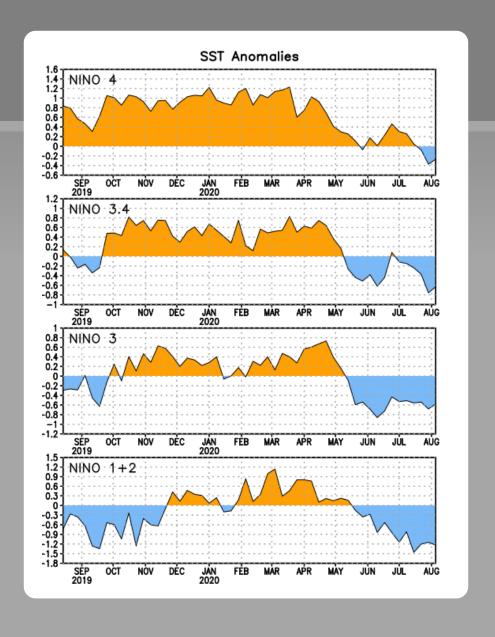

Niño Region SST Departures (°C) Recent Evolution

The latest weekly SST departures are:

Niño 4 -0.3°C Niño 3.4 -0.6°C Niño 3 -0.6°C Niño 1+2 -1.2°C

Weekly Heat Content Evolution in the Equatorial Pacific

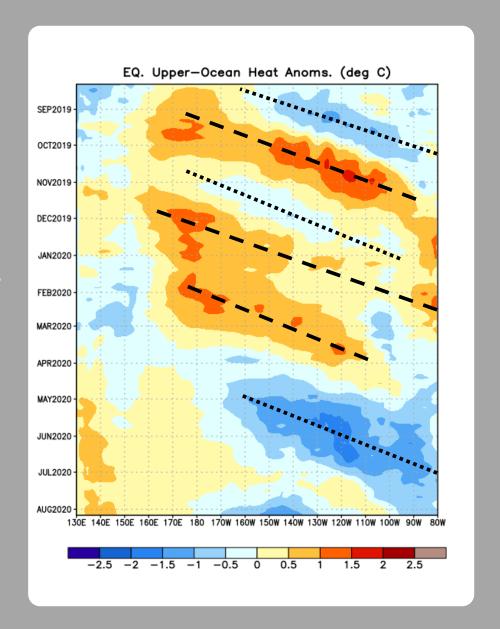

Significant equatorial oceanic Kelvin wave activity (dashed and dotted lines) has been present throughout the period shown.

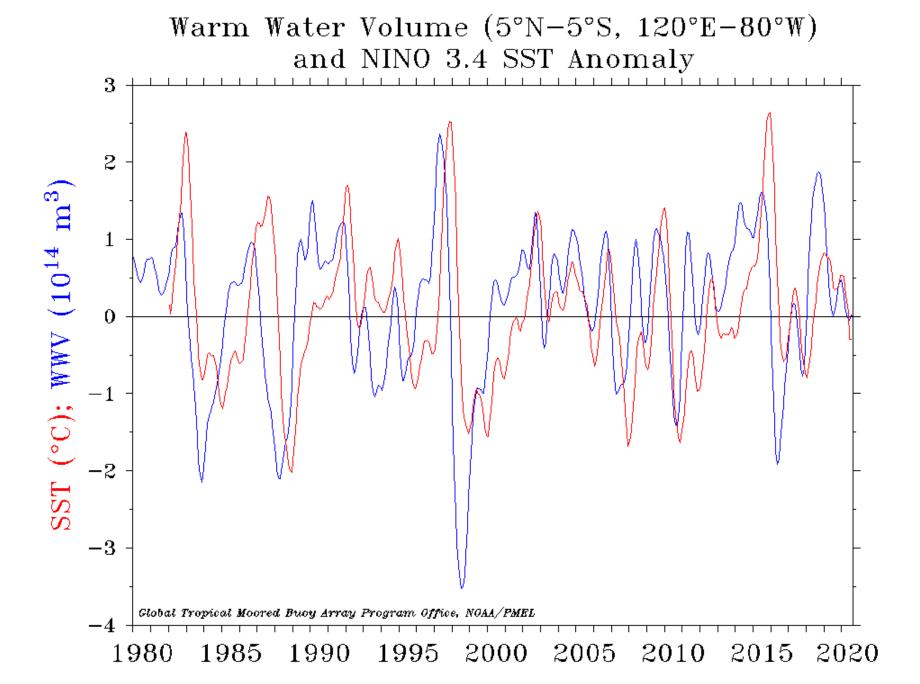

From December 2019 to February 2020, downwelling Kelvin waves (dashed line) resulted in above-average subsurface temperatures across the central and east-central equatorial Pacific.

From April-June 2020, negative subsurface temperature anomalies expanded eastward in association with an upwelling Kelvin wave.

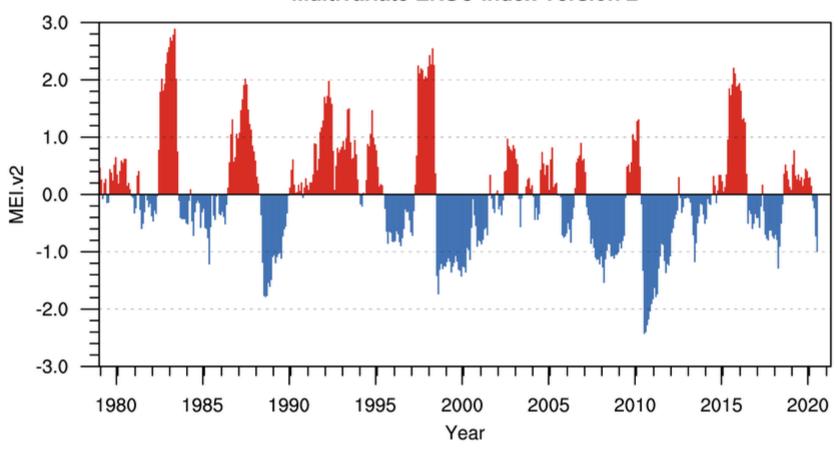

In July 2020, negative anomalies strengthened in the east-central Pacific Ocean.

Equatorial oceanic Kelvin waves have alternating warm and cold phases. The warm phase is indicated by dashed lines. Downwelling and warming occur in the leading portion of a Kelvin wave, and up-welling and cooling occur in the trailing portion.

MEI.v2 Evolution of Historical ENSO Events

IRI/CPC Pacific Niño 3.4 SST Model Outlook

The averages of the models predict a borderline or weak La Niña into the Northern Hemisphere winter 2020-21.

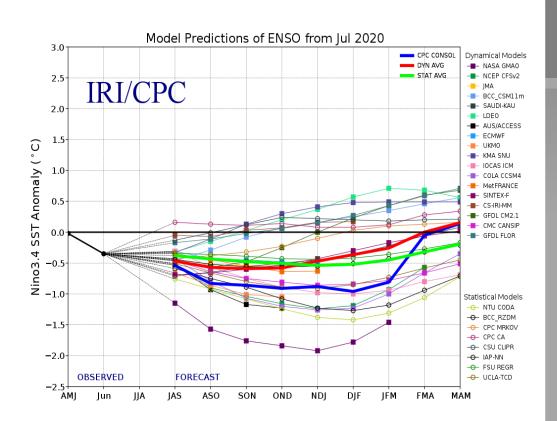

Figure provided by the International Research Institute (IRI) for Climate and Society (updated 20 July 2020).

Historical El Niño and La Niña Episodes Based on the ONI computed using ERSST.v5

Recent Pacific warm (red) and cold (blue) periods based on a threshold of +/- 0.5 °C for the Oceanic Nino Index (ONI) [3 month running mean of ERSST.v5 SST anomalies in the Nino 3.4 region (5N-5S, 120-170W)]. For historical purposes, periods of below and above normal SSTs are colored in blue and red when the threshold is met for a minimum of 5 consecutive over-lapping seasons.

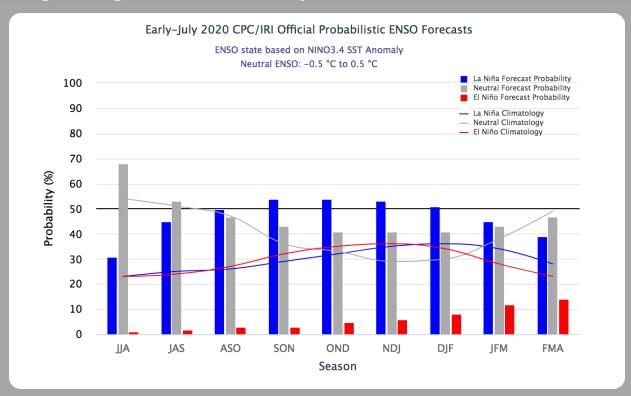

The ONI is one measure of the El Niño-Southern Oscillation, and other indices can confirm whether features consistent with a coupled ocean-atmosphere phenomenon accompanied these periods. The complete table going back to DJF 1950 can be found here.

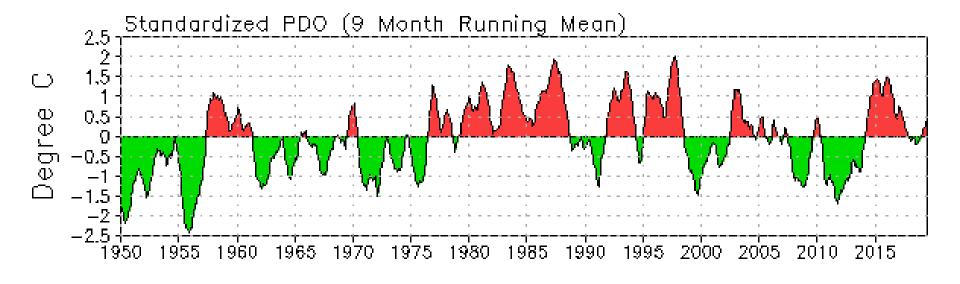

Year	DJF	JFM	FMA	MAM	AMJ	MJJ	JJA	JAS	ASO	SON	OND	NDJ

CPC/IRI Probabilistic ENSO Outlook

Updated: 9 July 2020

ENSO-neutral is most likely to continue through the Northern Hemisphere summer 2020, with La Niña favored (50-55% chance) beginning in August-October 2020 and continuing through Northern Hemisphere winter 2020-21.

Accumulated Cyclone Energy (ACE) (106)	150	160	160	200	23	177
Net Tropical Cyclone Activity (NTC) (116%)	160	170	170	215	31	184

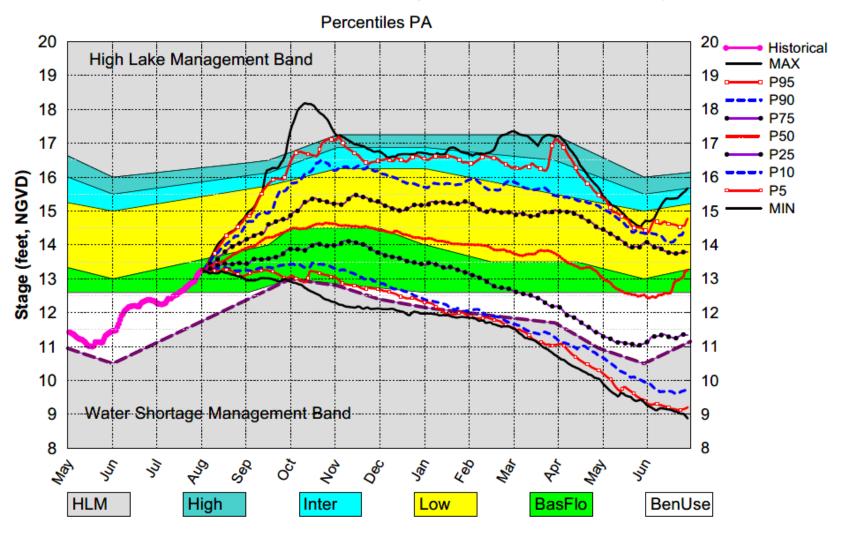

^{*}Total forecast includes Arthur, Bertha, Cristobal, Dolly, Edouard, Fay, Gonzalo, Hanna and Isaias which have formed in the Atlantic as of August 4th.

- Extremely active season
- Sea surface temperatures averaged across the tropical Atlantic are much warmer than normal
- Vertical wind shear is well below average
- Current cool neutral ENSO conditions may transition to weak La Niña conditions by later this summer

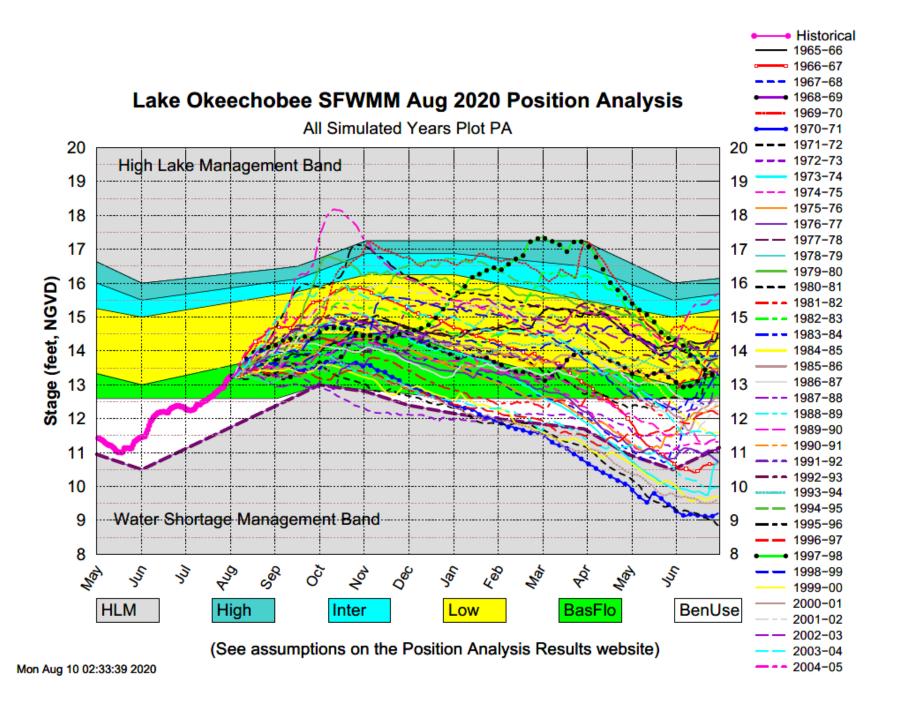

Dynamic Position Analysis

- Based on historical climatic conditions spanning the period 1965-2005
- Each year the model resets the initial stages for Lake Okeechobee (LOK) and the Water Conservation Areas (WCAs) to value on the 1st of the previous month and conditions the simulation using real time data during the previous month to achieve real time stage on the 1st or 15th of the current month for both Lake Okeechobee and the Water Conservation Areas
- Dynamic Position Analysis
 - Each 1-year simulation starts with current hydrologic conditions (e.g., 1-August-2020)
 - 41 1-year simulations of system response to historical rainfall conditions
 - Statistical summaries used to display projections
