

# EXTENDED HYDROLOGIC OUTLOOK

## FEBRUARY 12, 2019

Sea surface temperature anomaly / Anomalie de la température de la mer (C)

Snow depth / Épaisseur de la neige (cm)

Uncovered sea ice  
Glacé marine à découvrir  
Climatologie 1995-2009 Climatologie

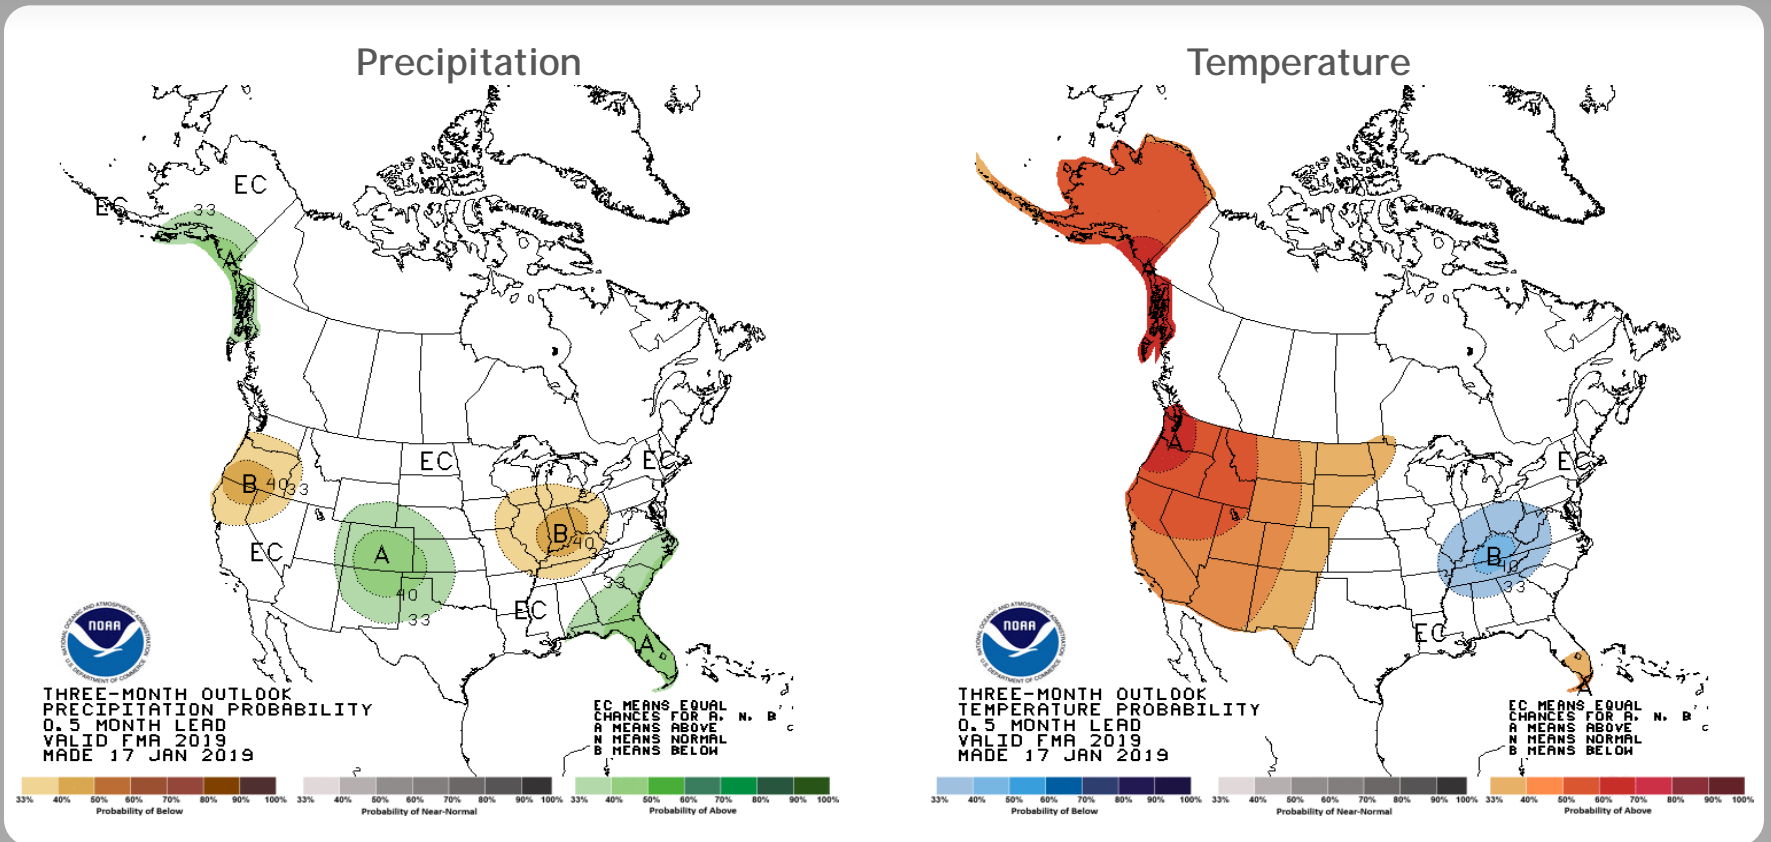

# Summary

- The Climate Prediction Center (CPC) is forecasting above normal rainfall for February through April.
- ENSO-neutral conditions are present. El Niño is expected to form and continue through the Northern Hemisphere spring 2019 (~65% chance). El Niño increases the chances of a wetter-than-normal dry season.
- Monitoring Atlantic Multidecadal Oscillation (AMO) index for switch to negative (cold) phase, this has the potential to contribute to drier-than-normal wet seasons.

# U. S. Seasonal Outlooks

February - April 2019

The seasonal outlooks combine the effects of long-term trends, soil moisture, and, when appropriate, ENSO.

# Teleconnections to South Florida

Climate anomalies being related to each other at large distances:

## El Niño Southern Oscillation (ENSO)

South Florida dry season (November through May) rainfall is positively correlated with El Niño which has a frequency that ranges between 3 to 7 years while rainfall is negatively correlated with La Niña November through March with a potential increase in tropical rainfall during La Niña

## Atlantic Multidecadal Oscillation (AMO)

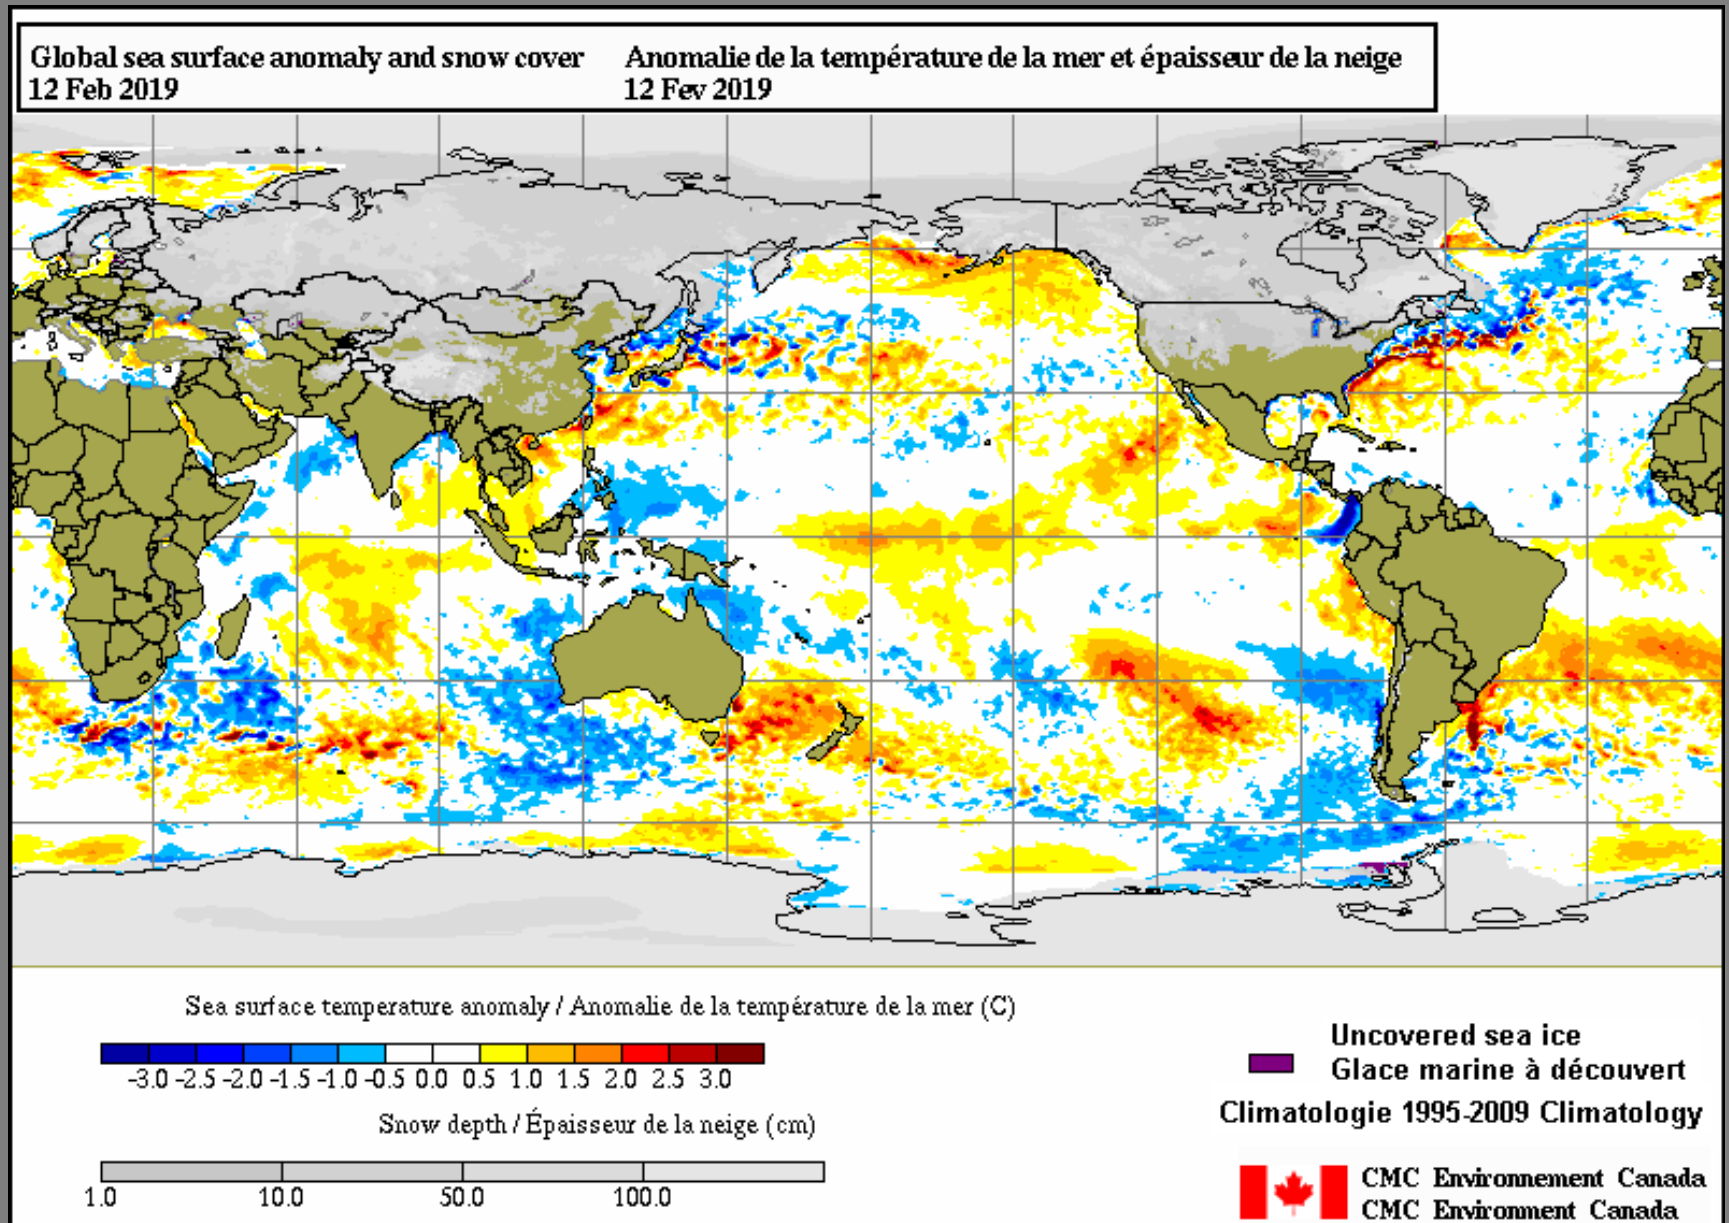

Average annual inflow to Lake Okeechobee is nearly 50% greater during the warm phase compared to the cold phase of the AMO, easterly flow toward south Florida affected by phase

## Pacific Decadal Oscillation (PDO)

Increases variations of south Florida dry season rainfall

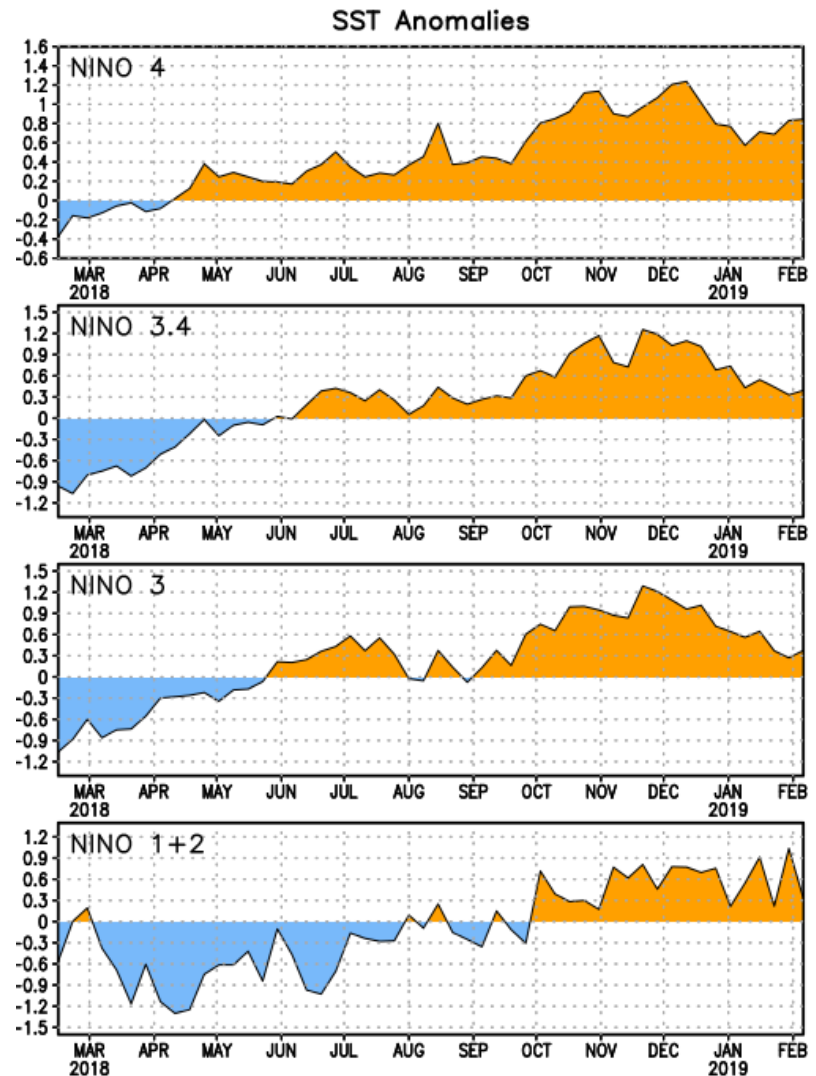

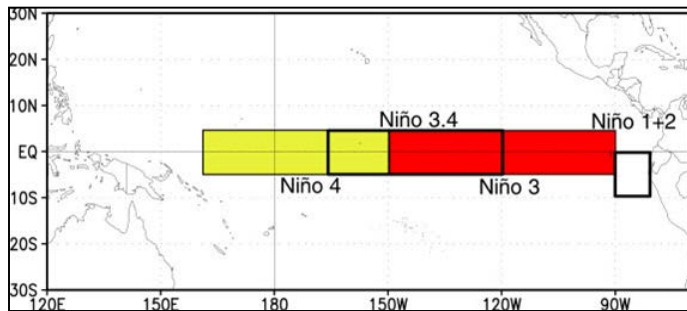

# Current Global Sea Surface Temperature Anomalies

# Niño Region SST Departures (°C) Recent Evolution

The latest weekly SST departures are:

Niño 4	0.8°C
Niño 3.4	0.4°C
Niño 3	0.4°C
Niño 1+2	0.3°C

# Weekly Heat Content Evolution in the Equatorial Pacific

In early August, October, and November 2018, positive subsurface temperature anomalies increased, partly due to downwelling Kelvin waves.

Since mid-December 2018, positive subsurface temperature anomalies weakened between 120°W and 90°W.

Since early January 2019, a downwelling Kelvin wave increased the positive subsurface temperature anomalies around the Date Line and east-central Pacific.

Equatorial oceanic Kelvin waves have alternating warm and cold phases. The warm phase is indicated by dashed lines. Downwelling and warming occur in the leading portion of a Kelvin wave, and up-welling and cooling occur in the trailing portion.

# IRI/CPC Pacific Niño

## 3.4 SST Model Outlook

The majority of models predict the Niño-3.4 index to slowly weaken into the Northern Hemisphere summer 2019.

Figure provided by the International Research Institute (IRI) for Climate and Society (updated 19 January 2019).

# Historical El Niño and La Niña Episodes Based on the ONI computed using ERSST.v5

Recent Pacific warm (red) and cold (blue) periods based on a threshold of  $\pm 0.5$  °C for the Oceanic Nino Index (ONI) [3 month running mean of ERSST.v5 SST anomalies in the Nino 3.4 region (5N-5S, 120-170W)]. For historical purposes, periods of below and above normal SSTs are colored in blue and red when the threshold is met for a minimum of 5 consecutive over-lapping seasons.

The ONI is one measure of the El Niño-Southern Oscillation, and other indices can confirm whether features consistent with a coupled ocean-atmosphere phenomenon accompanied these periods. The complete table going back to DJF 1950 can be found [here](#).

Year	DJF	JFM	FMA	MAM	AMJ	MJJ	JJA	JAS	ASO	SON	OND	NDJ

# CPC/IRI Probabilistic ENSO Outlook

Updated: 10 January 2019

El Niño is expected to form and continue through the Northern Hemisphere spring 2019 (~65% chance).

# El Niño & La Niña Events (1950-2018), and Lake Okeechobee Watershed Rainfall & Net Inflow

# Dynamic Position Analysis

- Based on historical climatic conditions spanning the period 1965-2005
- Each year the model resets the initial stages for Lake Okeechobee (LOK) and the Water Conservation Areas (WCAs) to value on the 1<sup>st</sup> of the previous month and conditions the simulation using real time data during the previous month to achieve real time stage on the 1<sup>st</sup> of the current month for both Lake Okeechobee and the Water Conservation Areas
- **Dynamic Position Analysis**
  - Each 1-year simulation starts with current hydrologic conditions (e.g., 1-Dec-2018)
  - 41 1-year simulations of system response to historical rainfall conditions
  - Statistical summaries used to display projections
