

Extended Hydrologic Outlook

July 13, 2026

- The Climate Prediction Center (CPC) is forecasting equal chances of below normal, normal and above normal rainfall for July through September.
- El Niño conditions are present and will strengthen through the end of the year, with a 97% chance it will persist through early spring 2027.
- Atlantic Multidecadal Oscillation (AMO) is currently in the warm phase:
 - Average annual inflow to Lake Okeechobee is nearly 50% greater during the warm phase compared to the cold phase.

U. S. Seasonal Outlooks

July - September 2026

The seasonal outlooks combine the effects of long-term trends, soil moisture, and, when appropriate, ENSO.

Teleconnections to South Florida

Climate anomalies being related to each other at large distances:

El Niño Southern Oscillation (ENSO)

- El Niño increases the chances of a wetter-than-normal dry season and decreased tropical activity, La Niña increases the chances of a drier-than-normal dry season and increased tropical activity (both have most influence in south Florida from November through March)

Pacific Decadal Oscillation (PDO)

- Increases variations in south Florida dry season rainfall, positive leads to more El Niño events, negative leads to more La Niña events
- The current PDO is negative

Atlantic Multidecadal Oscillation (AMO)

- Average annual inflow to Lake Okeechobee is nearly 50% greater during the warm phase compared to the cold phase of the AMO, easterly flow toward south Florida affected by phase
- The AMO is currently in the warm phase

Niño Region SST Departures (°C) Recent Evolution

The latest weekly SST departures are:

Niño 4	0.5°C
Niño 3.4	1.3°C
Niño 3	1.7°C
Niño 1+2	2.6°C

Warm Water Volume (5°N–5°S, 120°E–80°W) and NINO 3.4 SST Anomaly

May 2026

ATLANTIC BASIN SEASONAL HURRICANE FORECAST FOR 2026

Forecast Parameter and 1991-2020 Average (in parentheses)	Issue Date 9 April 2026	Issue Date 10 June 2026	Issue Date 8 July 2026	Observed Thru 7 July 2026	Remainder of Season Forecast
Named Storms (NS) (14.4)	13	11	9	1	8
Named Storm Days (NSD) (69.4)	55	45	35	0.75	34.25
Hurricanes (H) (7.2)	6	5	4	0	4
Hurricane Days (HD) (27.0)	20	15	12	0	12
Major Hurricanes (MH) (3.2)	2	2	1	0	1
Major Hurricane Days (MHD) (7.4)	5	4	2	0	2
Accumulated Cyclone Energy (ACE) (123)	90	70	50	1	49
ACE West of 60°W (73)	50	35	25	1	24
Net Tropical Cyclone Activity (NTC) (135%)	100	80	60	2	58

- Well below-normal activity
- High potential for a moderate/strong El Niño for the peak of hurricane season (increased levels of tropical Atlantic vertical wind shear)
- Sea surface temperatures across the Caribbean and tropical Atlantic are near their long-term averages
- Next update: August 5, 2026

July 1, 2026 DPA Assumptions

- The July 1, 2026 Dynamic Position Analysis (DPA) simulation is based on historical climatic conditions spanning the period 1965-2016. This DPA posting is made with the South Florida Water Management Model (SFWMM) v7.3.6.
- The July 1, 2026 DPA resets the initial stages for Lake Okeechobee (LOK) and the Water Conservation Areas (WCAs) on June 1st of each year of the DPA simulation and conditions the simulation to real time data during June to achieve real time stages on July 1st for LOK and WCAs.
- The Lake Okeechobee operations follow the Lake Okeechobee System Operating Manual (LOSOM). Modeling assumptions are consistent with modeling performed for LOSOM Supplemental Environmental Impact Statement (SEIS).
- LOK Temporary Forward Pump operations will be in place, whenever necessary, to improve water supply deliveries from LOK under low LOK stages.
- STA surface area values are modified to reflect current flow ways under operation. STA depths are maintained to a minimum of 6 inches using Lake Okeechobee releases.
- Lake Okeechobee Water Shortage Management (LOWSM) is included in the simulation which reflects the currently approved 40E-21 and 40E-22 water shortage rules.

Conditional Position Analysis Overview

- CPA is a stochastic framework that transforms stages obtained from Dynamic Position Analysis (DPA) based on forecasted rainfall conditions over the next twelve months (Ali, 2016).
- CPA depends on DPA - DPA stage outputs are used as inputs to CPA. DPA uses a physically based model (SFWMM) to forecast stages progression over 1 year from the currently observed stages using 52-years of historical rainfall.
- CPA is implemented for 200+ locations in the Everglades including Lake Okeechobee.

Conditional Position Analysis (CPA) Gage Locations

July 1, 2026 CPA: Preferred Rainfall Scenario

Seasonal rainfall probabilities are calculated based on historical data and projected Relative Oceanic Nino-3.4 Index (RONI) published by the CPC.

Lake Okeechobee – The CPA implementation shows all percentile lines shift downward by about 0.02 to 0.28 feet relative to the corresponding DPA percentile lines at the beginning of the dry season on November 1, 2026. Under the Preferred Scenario (PrefSce), the median (50th percentile), 75th, and 25th percentile traces project stages of 13.18 feet NGVD29 (11.88 feet NAVD88), 14.56 feet NGVD29 (13.26 feet NAVD88), and 12.04 feet NGVD29 (10.74 feet NAVD88), respectively, at the start of the dry season in November 2026.
