# Summary

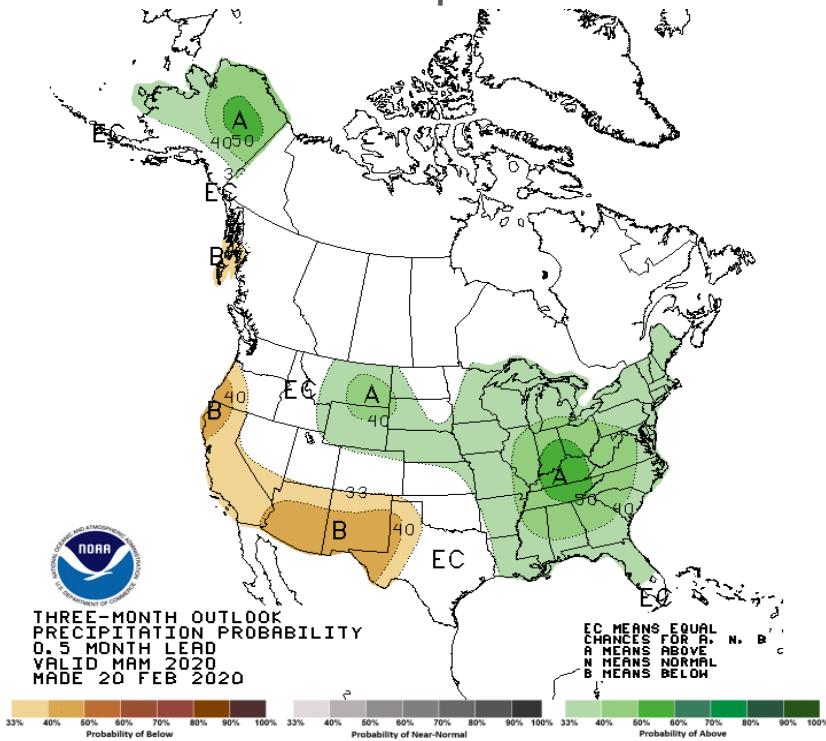

- The Climate Prediction Center (CPC) is forecasting above normal rainfall for areas north of Lake Okeechobee and equal chances of below normal, normal and above normal rainfall for Lake Okeechobee and areas south of Lake Okeechobee from March through May.
- ENSO-neutral conditions are present and favored through spring 2020 (~60% chance), continuing through summer 2020 (~50% chance). El Niño increases the chances of a wetter-than-normal dry season, La Niña increases the chances of a drier-than-normal dry season (both have most influence November through March).
- Monitoring Atlantic Multidecadal Oscillation (AMO) which is currently in the warm phase
  - Average annual inflow to Lake Okeechobee is nearly 50% greater during the warm phase compared to the cold phase

# U. S. Seasonal Outlooks

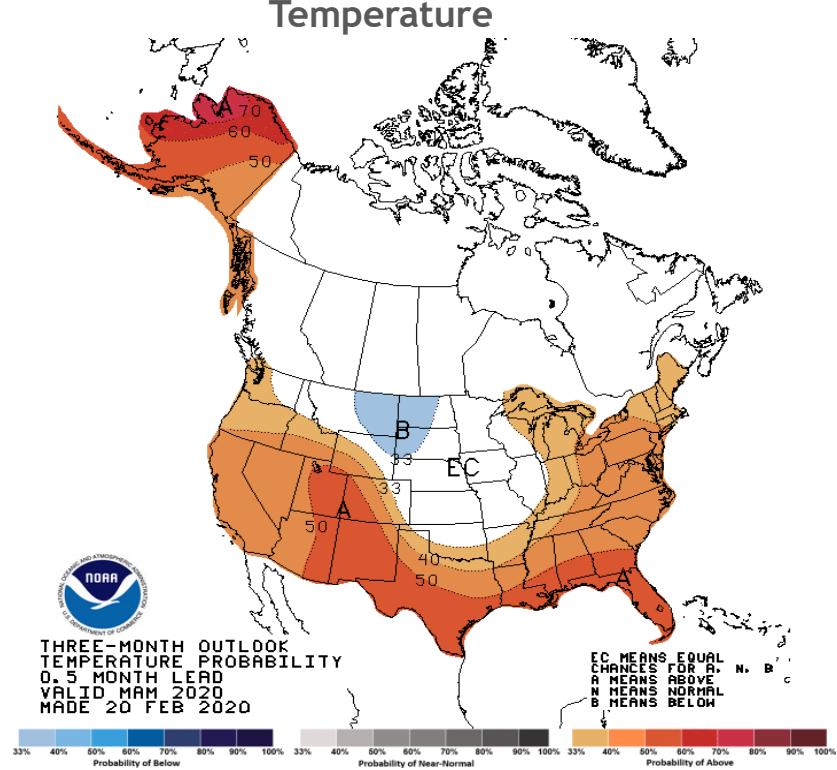

March-May 2020

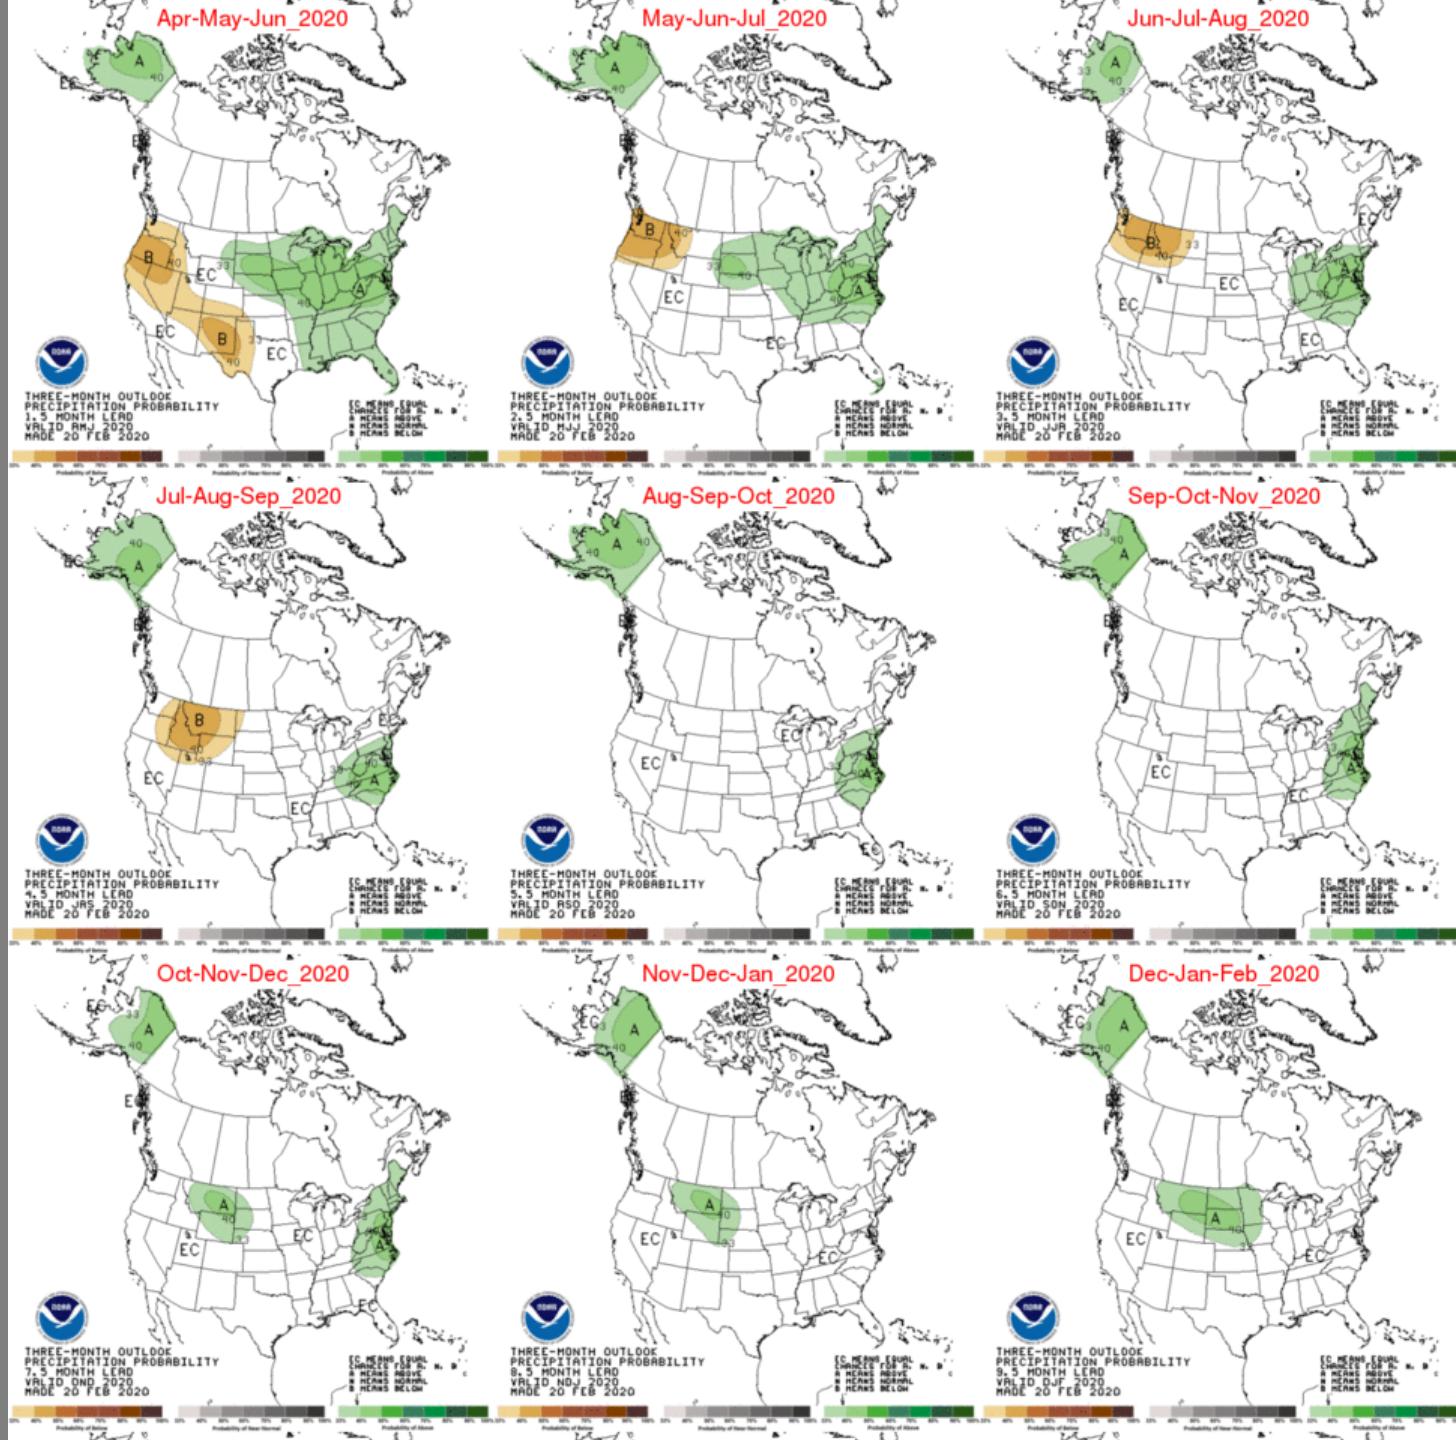

The seasonal outlooks combine the effects of long-term trends, soil moisture, and, when appropriate, ENSO.

Precipitation

Temperature

# Teleconnections to South Florida

Climate anomalies being related to each other at large distances:

## El Niño Southern Oscillation (ENSO)

South Florida dry season (November through May) rainfall is positively correlated with El Niño which has a frequency that ranges between 3 to 7 years while rainfall is negatively correlated with La Niña November through March with a potential increase in tropical rainfall during La Niña

## Atlantic Multidecadal Oscillation (AMO)

Average annual inflow to Lake Okeechobee is nearly 50% greater during the warm phase compared to the cold phase of the AMO, easterly flow toward south Florida affected by phase

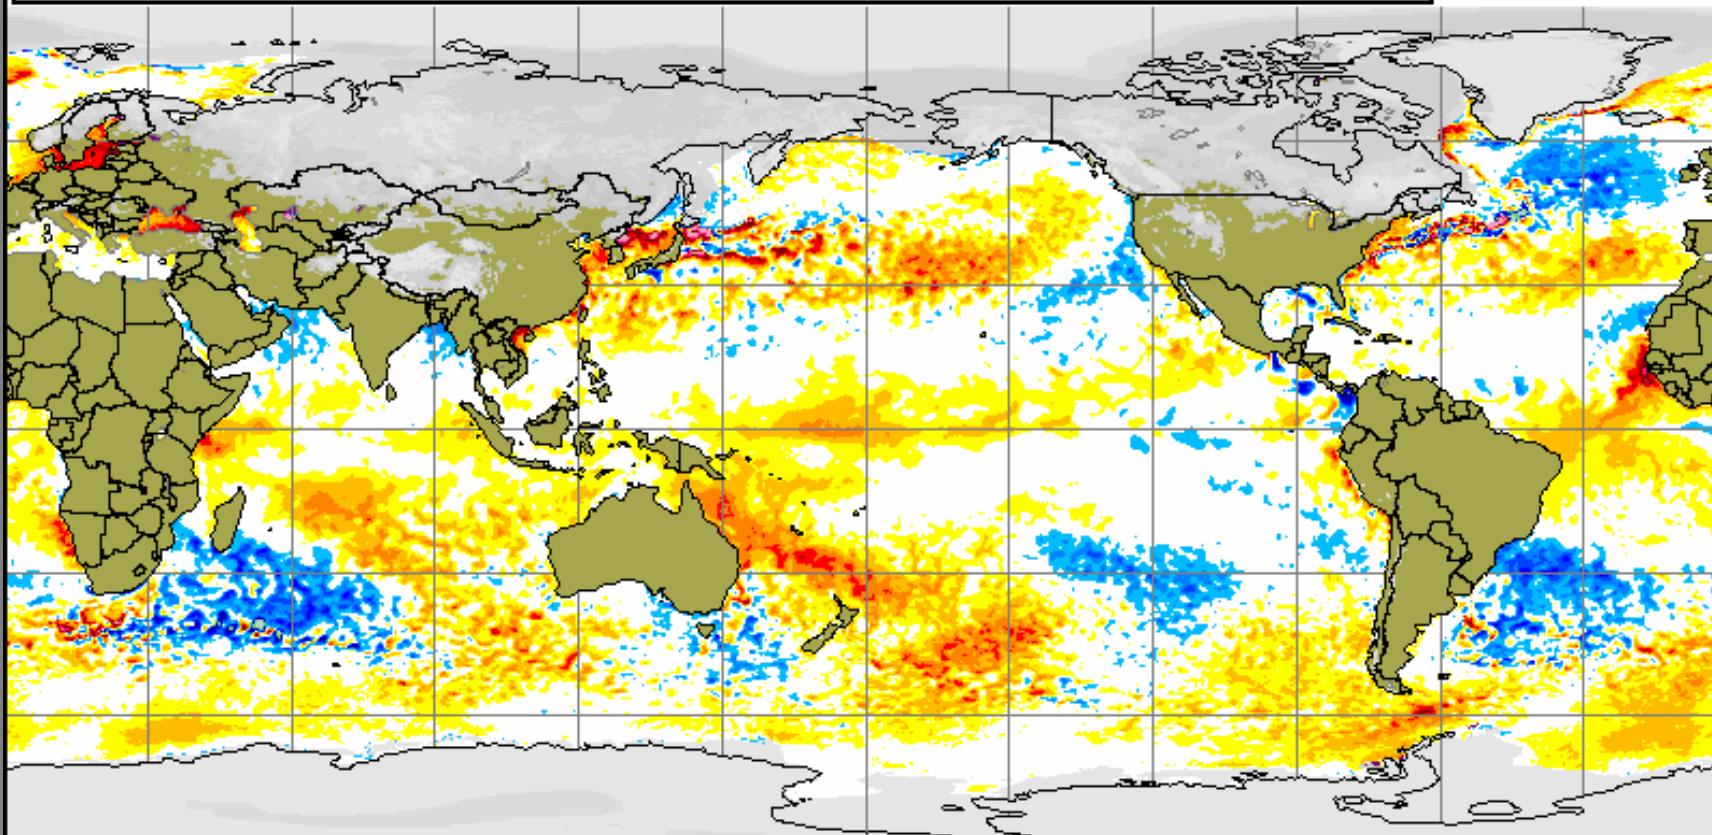

## Pacific Decadal Oscillation (PDO)

Increases variations of south Florida dry season rainfall

# Niño Region SST Departures ( $^{\circ}$ C) Recent Evolution

The latest weekly  
SST departures are:

Niño 4	1.1 $^{\circ}$ C
Niño 3.4	0.5 $^{\circ}$ C
Niño 3	0.1 $^{\circ}$ C
Niño 1+2	1.1 $^{\circ}$ C

# Weekly Heat Content Evolution in the Equatorial Pacific

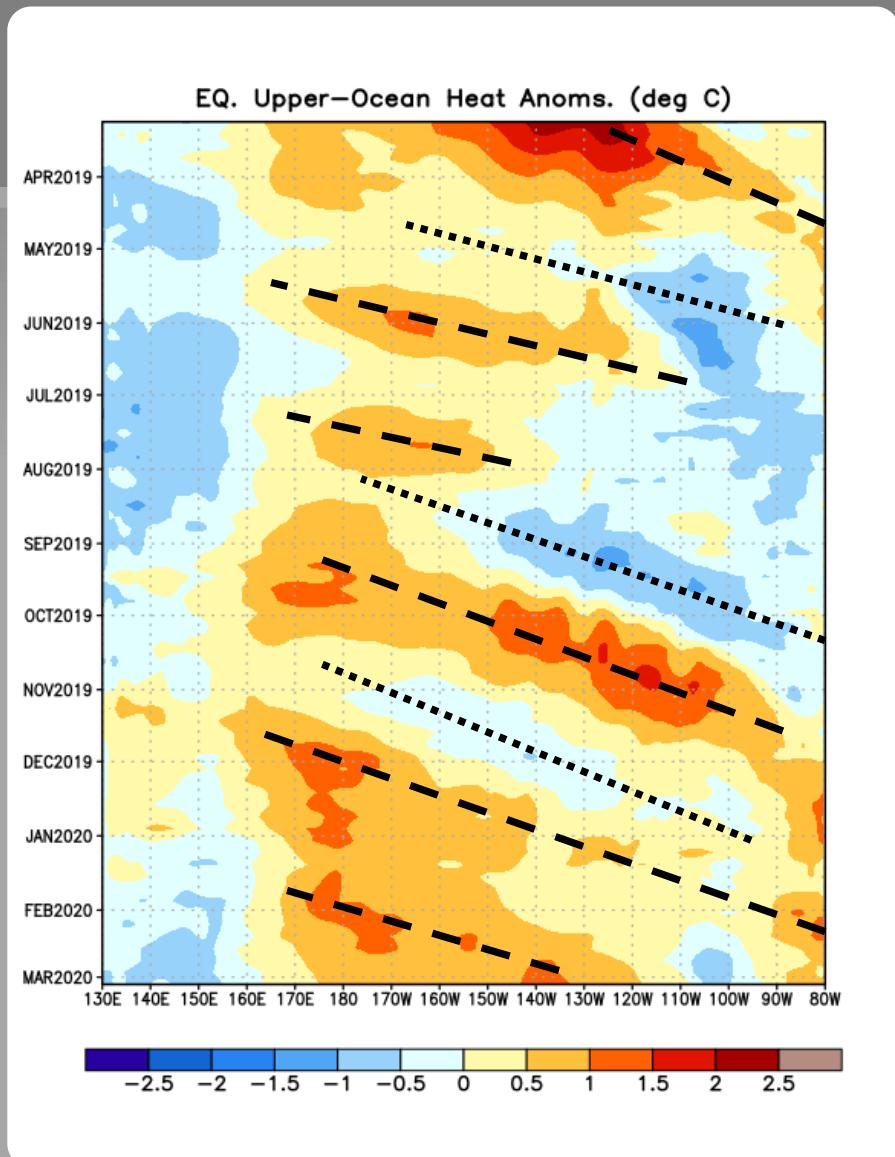

Significant equatorial oceanic Kelvin wave activity (dashed and dotted lines) has been present throughout the period shown.

During December 2019 and January 2020, a downwelling Kelvin wave (dashed line) resulted in above-average subsurface temperatures across the central and east-central equatorial Pacific.

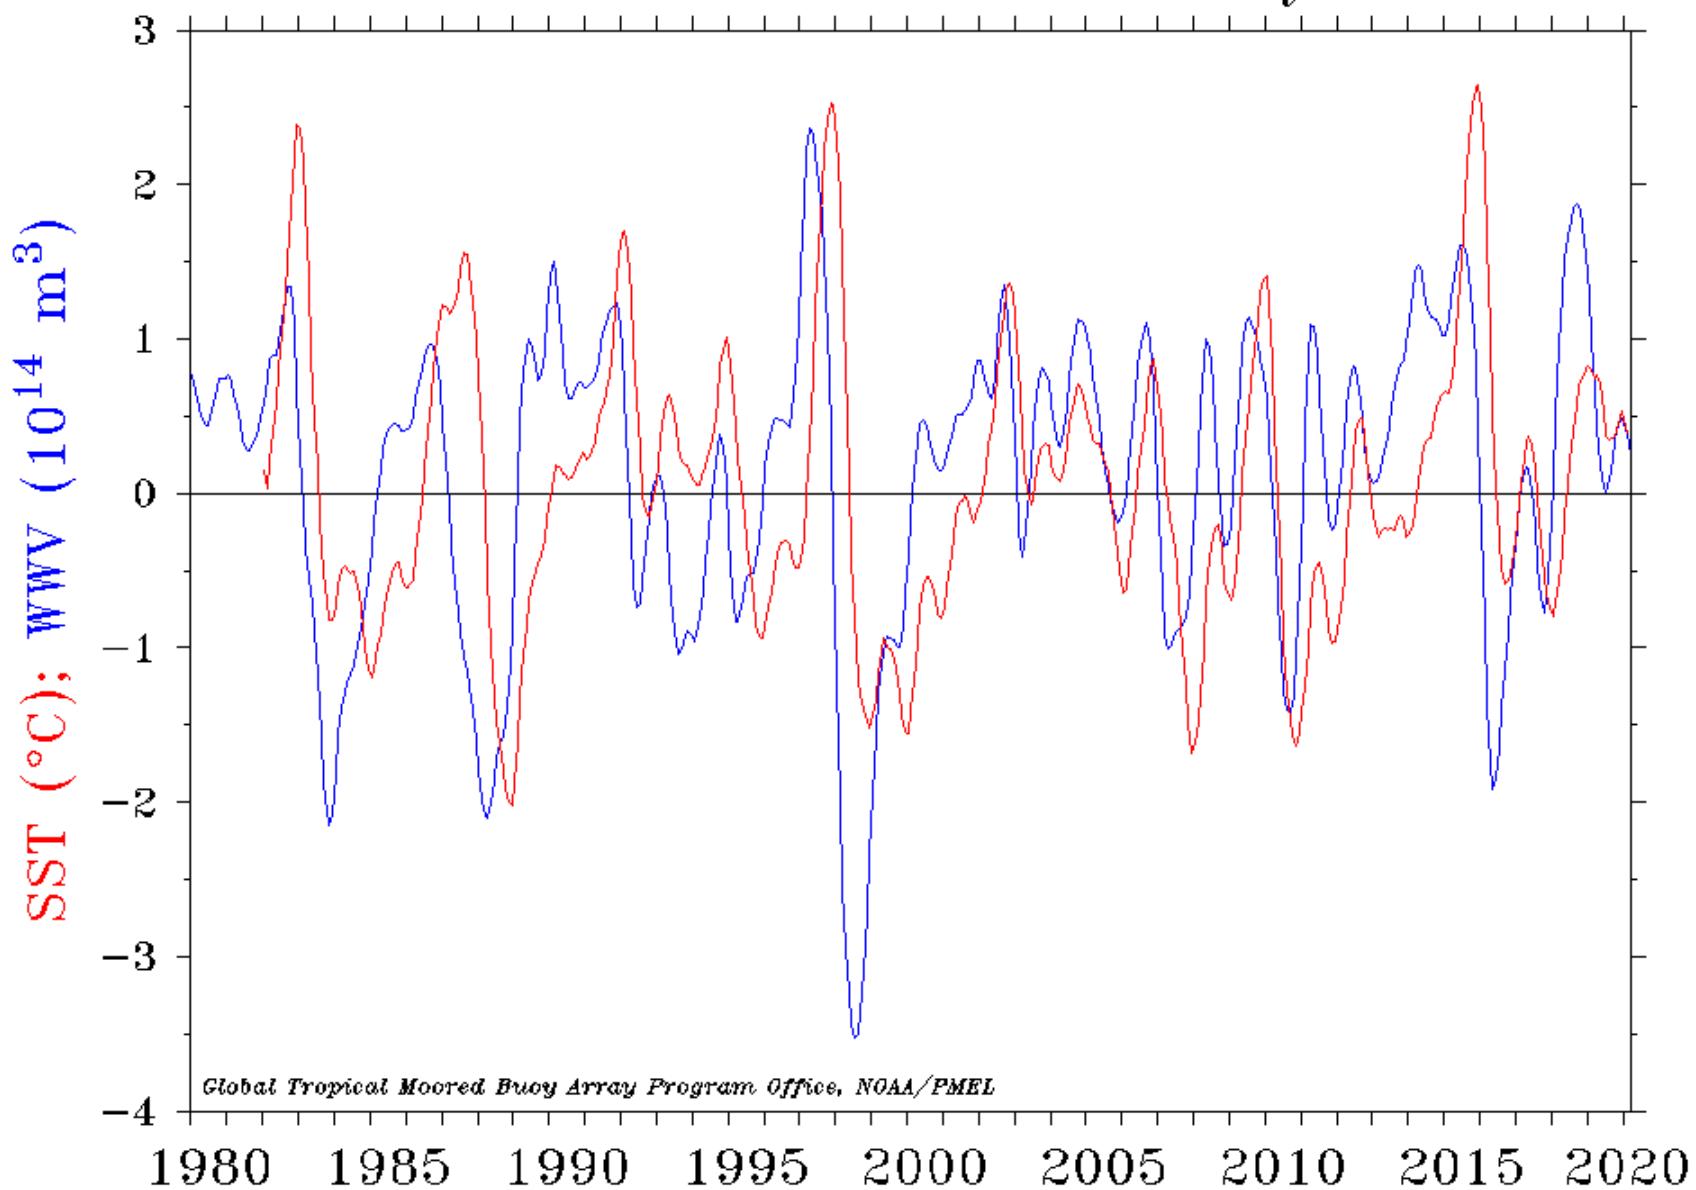

Since mid-December 2019, above-average temperatures have persisted between  $\sim 170^{\circ}\text{E}$  and  $\sim 140^{\circ}\text{W}$ .

Recently, a downwelling Kelvin wave increased temperature anomalies in the east-central Pacific.

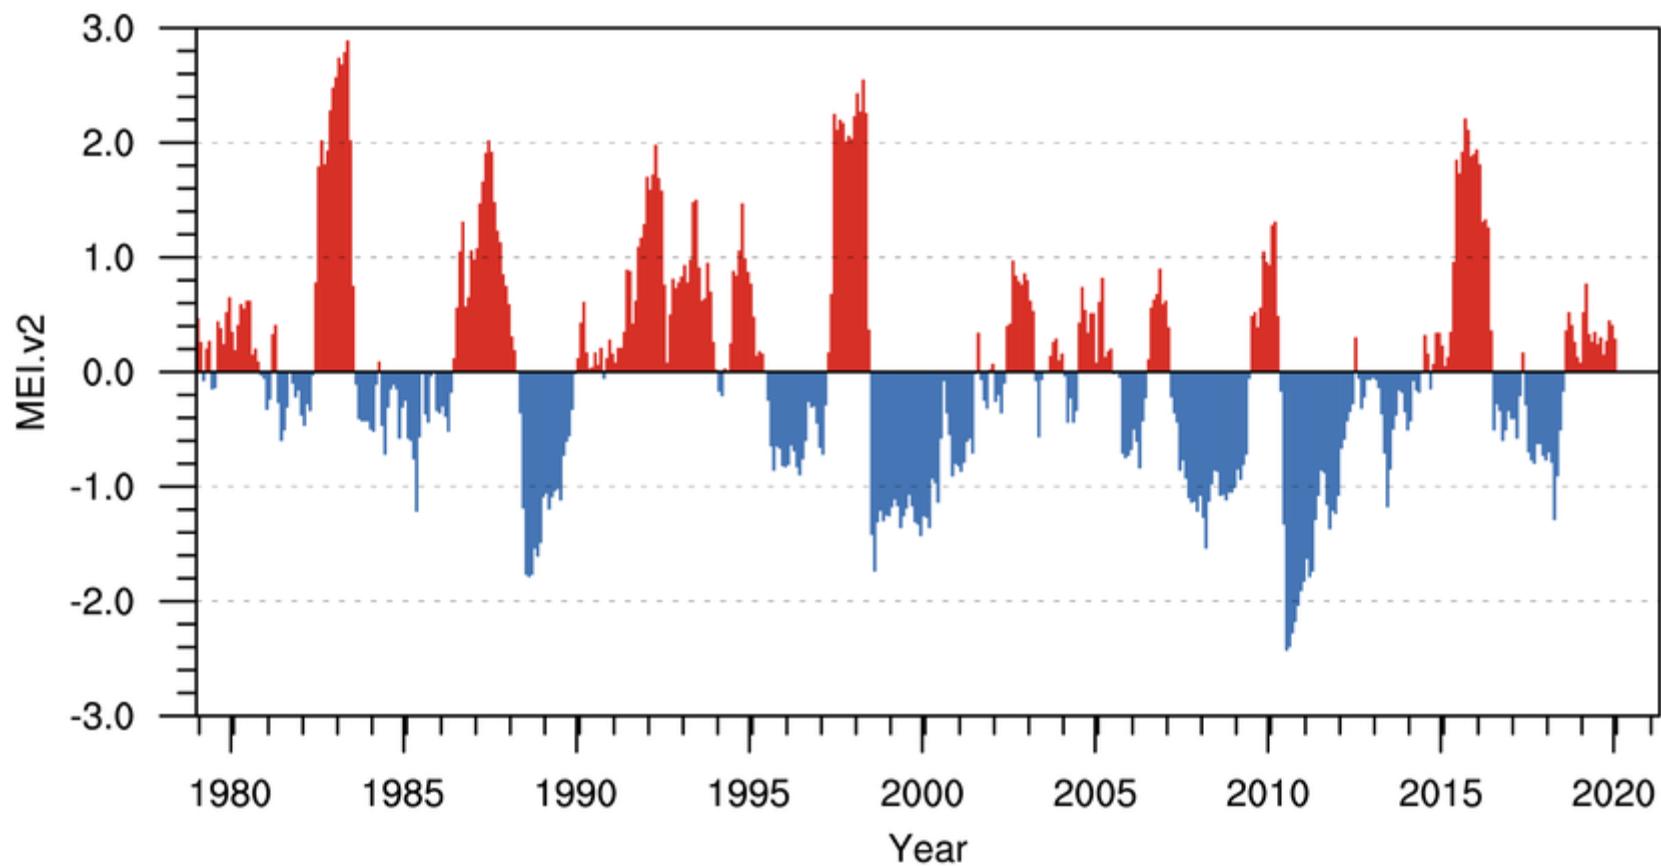

Equatorial oceanic Kelvin waves have alternating warm and cold phases. The warm phase is indicated by dashed lines. Downwelling and warming occur in the leading portion of a Kelvin wave, and up-welling and cooling occur in the trailing portion.

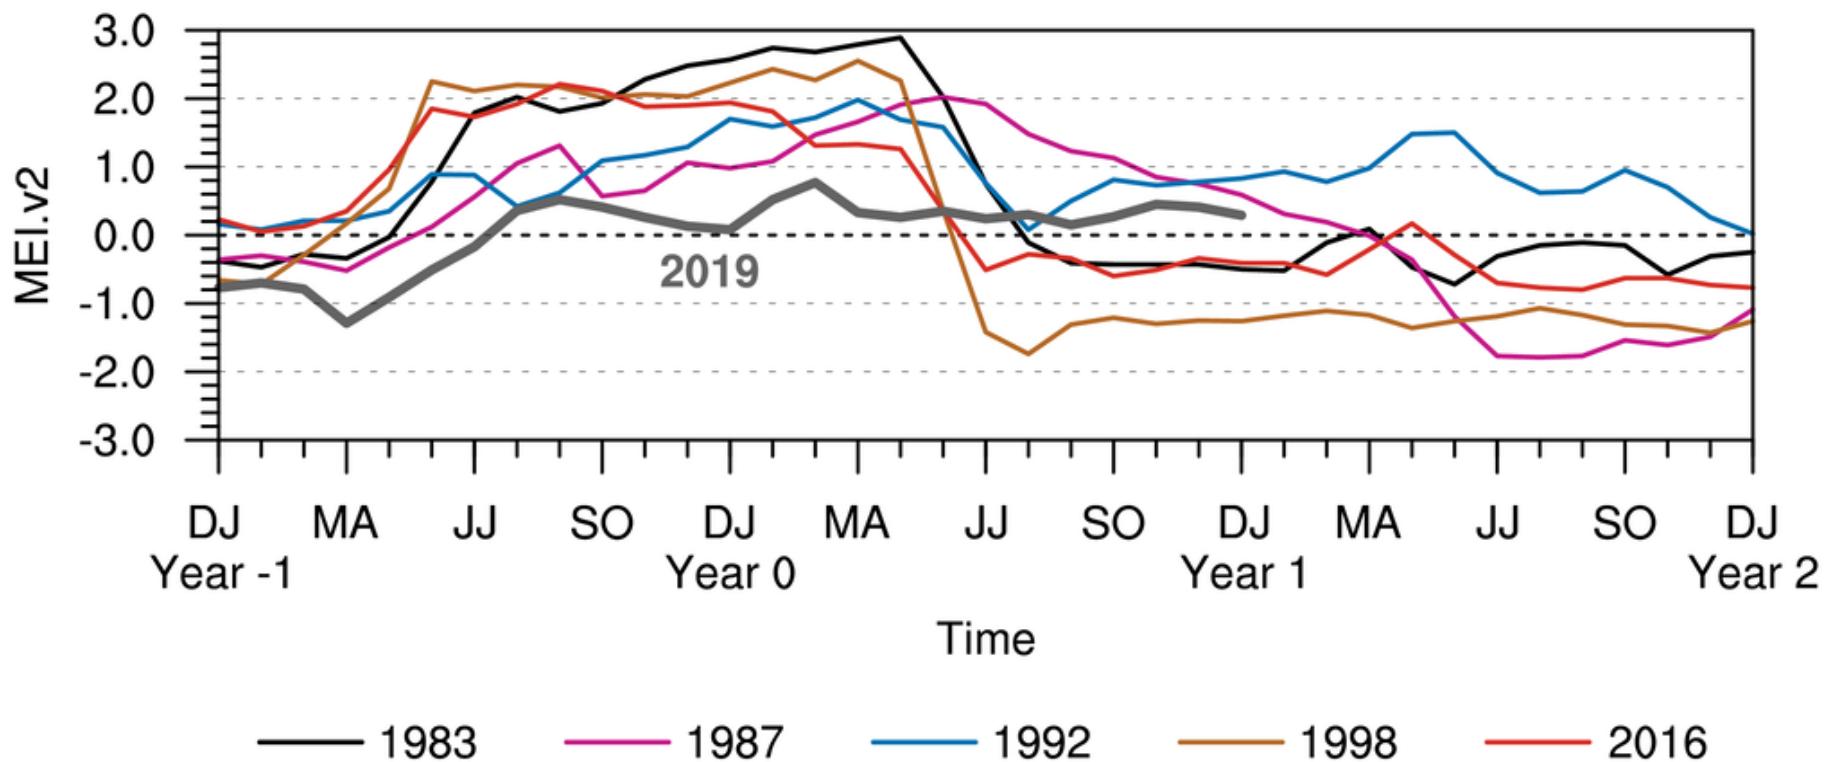

Warm Water Volume ( $5^{\circ}\text{N}$ – $5^{\circ}\text{S}$ ,  $120^{\circ}\text{E}$ – $80^{\circ}\text{W}$ )  
and NINO 3.4 SST Anomaly

# IRI/CPC Pacific Niño

## 3.4 SST Model Outlook

A majority of models favor ENSO-neutral through the Northern Hemisphere summer 2020.

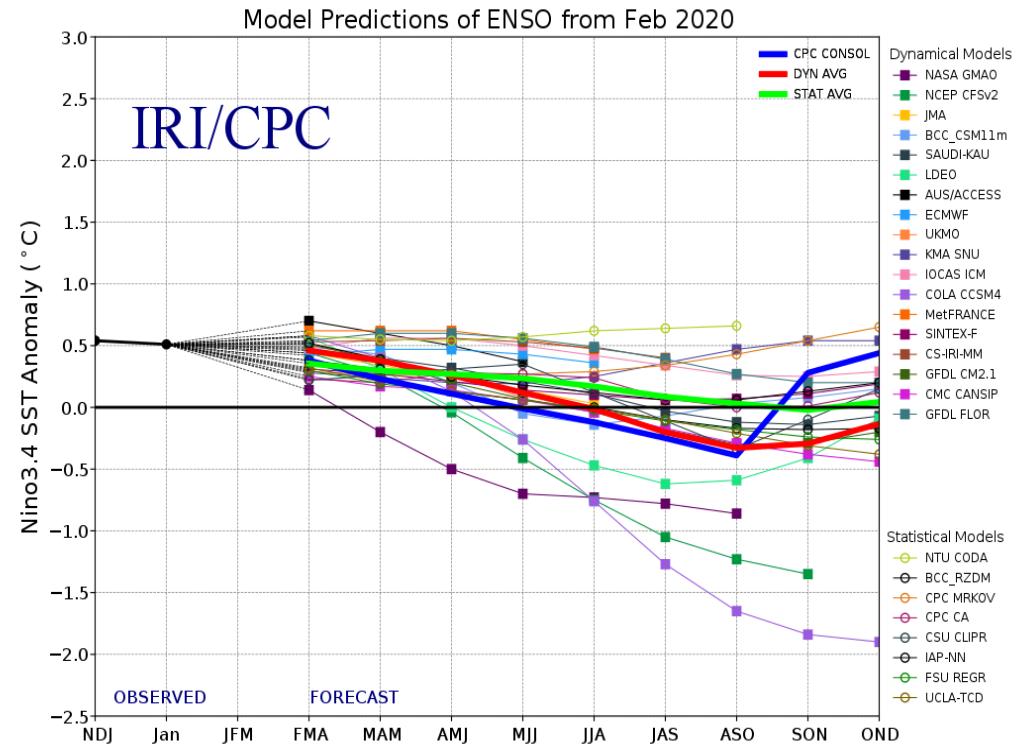

Figure provided by the International Research Institute (IRI) for Climate and Society (updated 19 February 2020).

# Historical El Niño and La Niña Episodes Based on the ONI computed using ERSST.v5

Recent Pacific warm (red) and cold (blue) periods based on a threshold of +/- 0.5 °C for the Oceanic Nino Index (ONI) [3 month running mean of ERSST.v5 SST anomalies in the Nino 3.4 region (5N-5S, 120-170W)]. For historical purposes, periods of below and above normal SSTs are colored in blue and red when the threshold is met for a minimum of 5 consecutive over-lapping seasons.

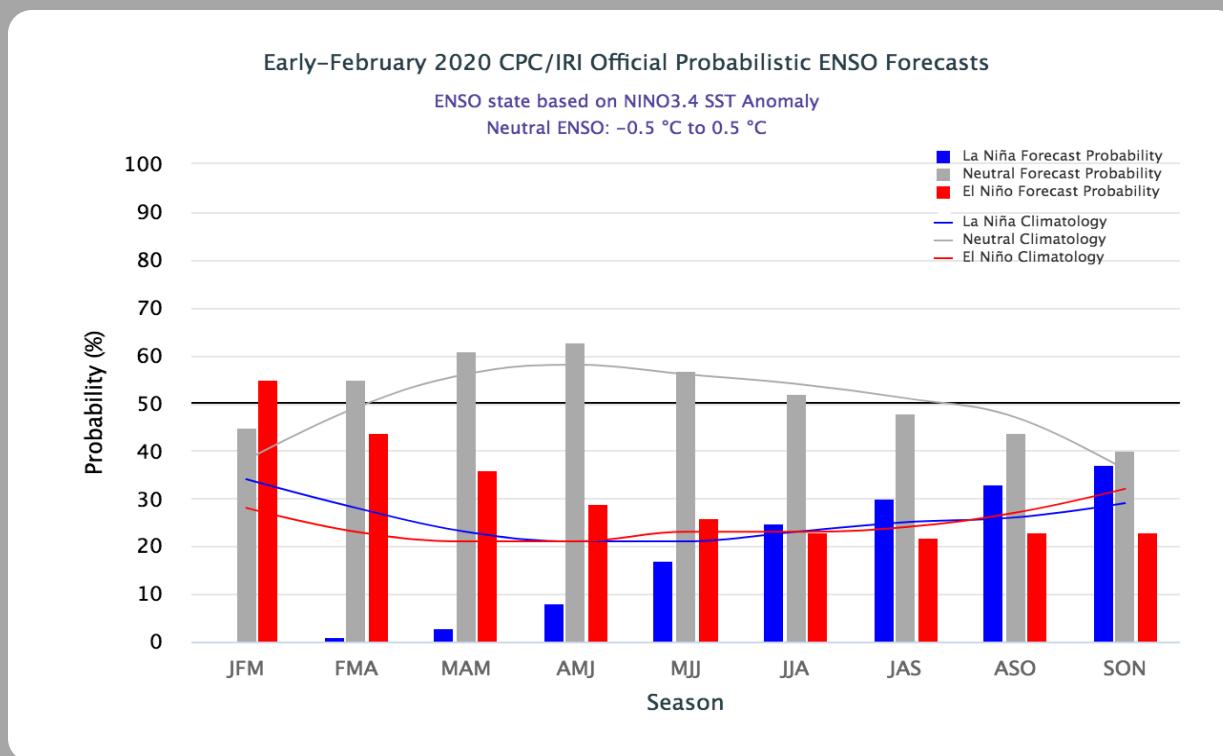

The ONI is one measure of the El Niño-Southern Oscillation, and other indices can confirm whether features consistent with a coupled ocean-atmosphere phenomenon accompanied these periods. The complete table going back to DJF 1950 can be found [here](#).

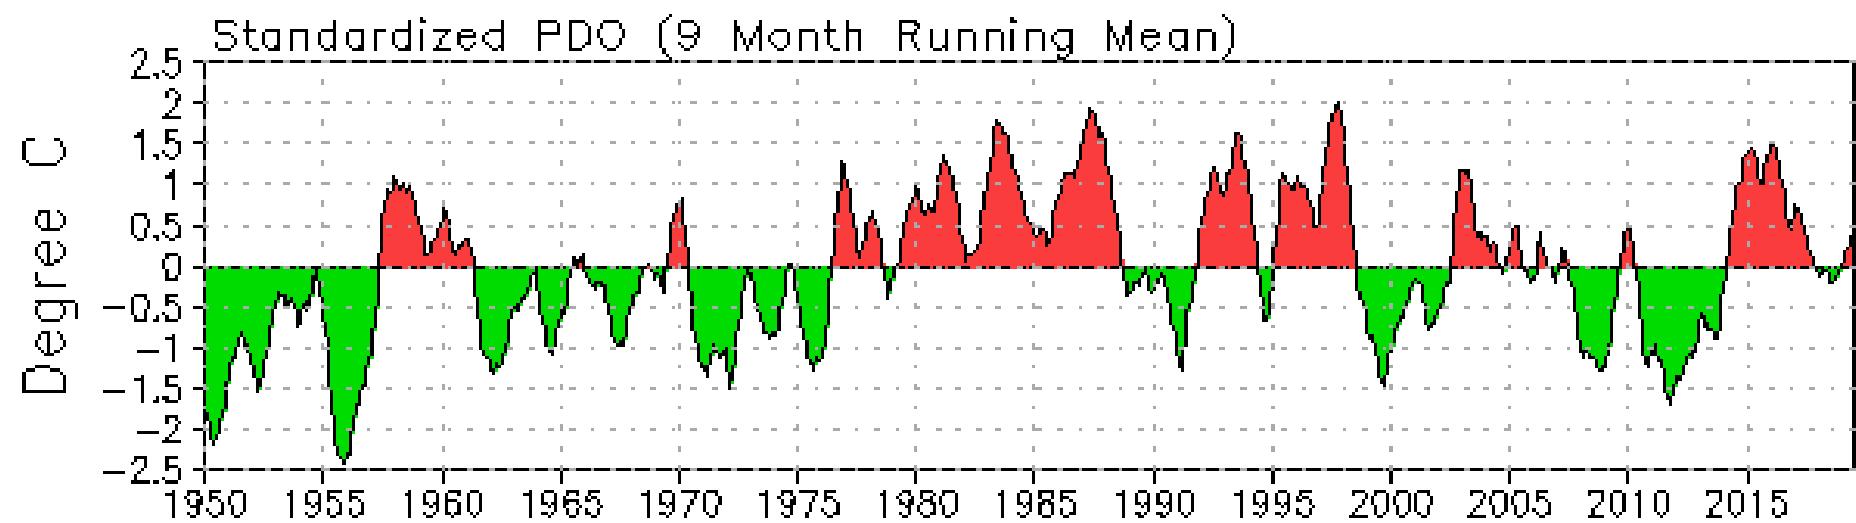

Year	DJF	JFM	FMA	MAM	AMJ	MJJ	JJA	JAS	ASO	SON	OND	NDJ

# CPC/IRI Probabilistic ENSO Outlook

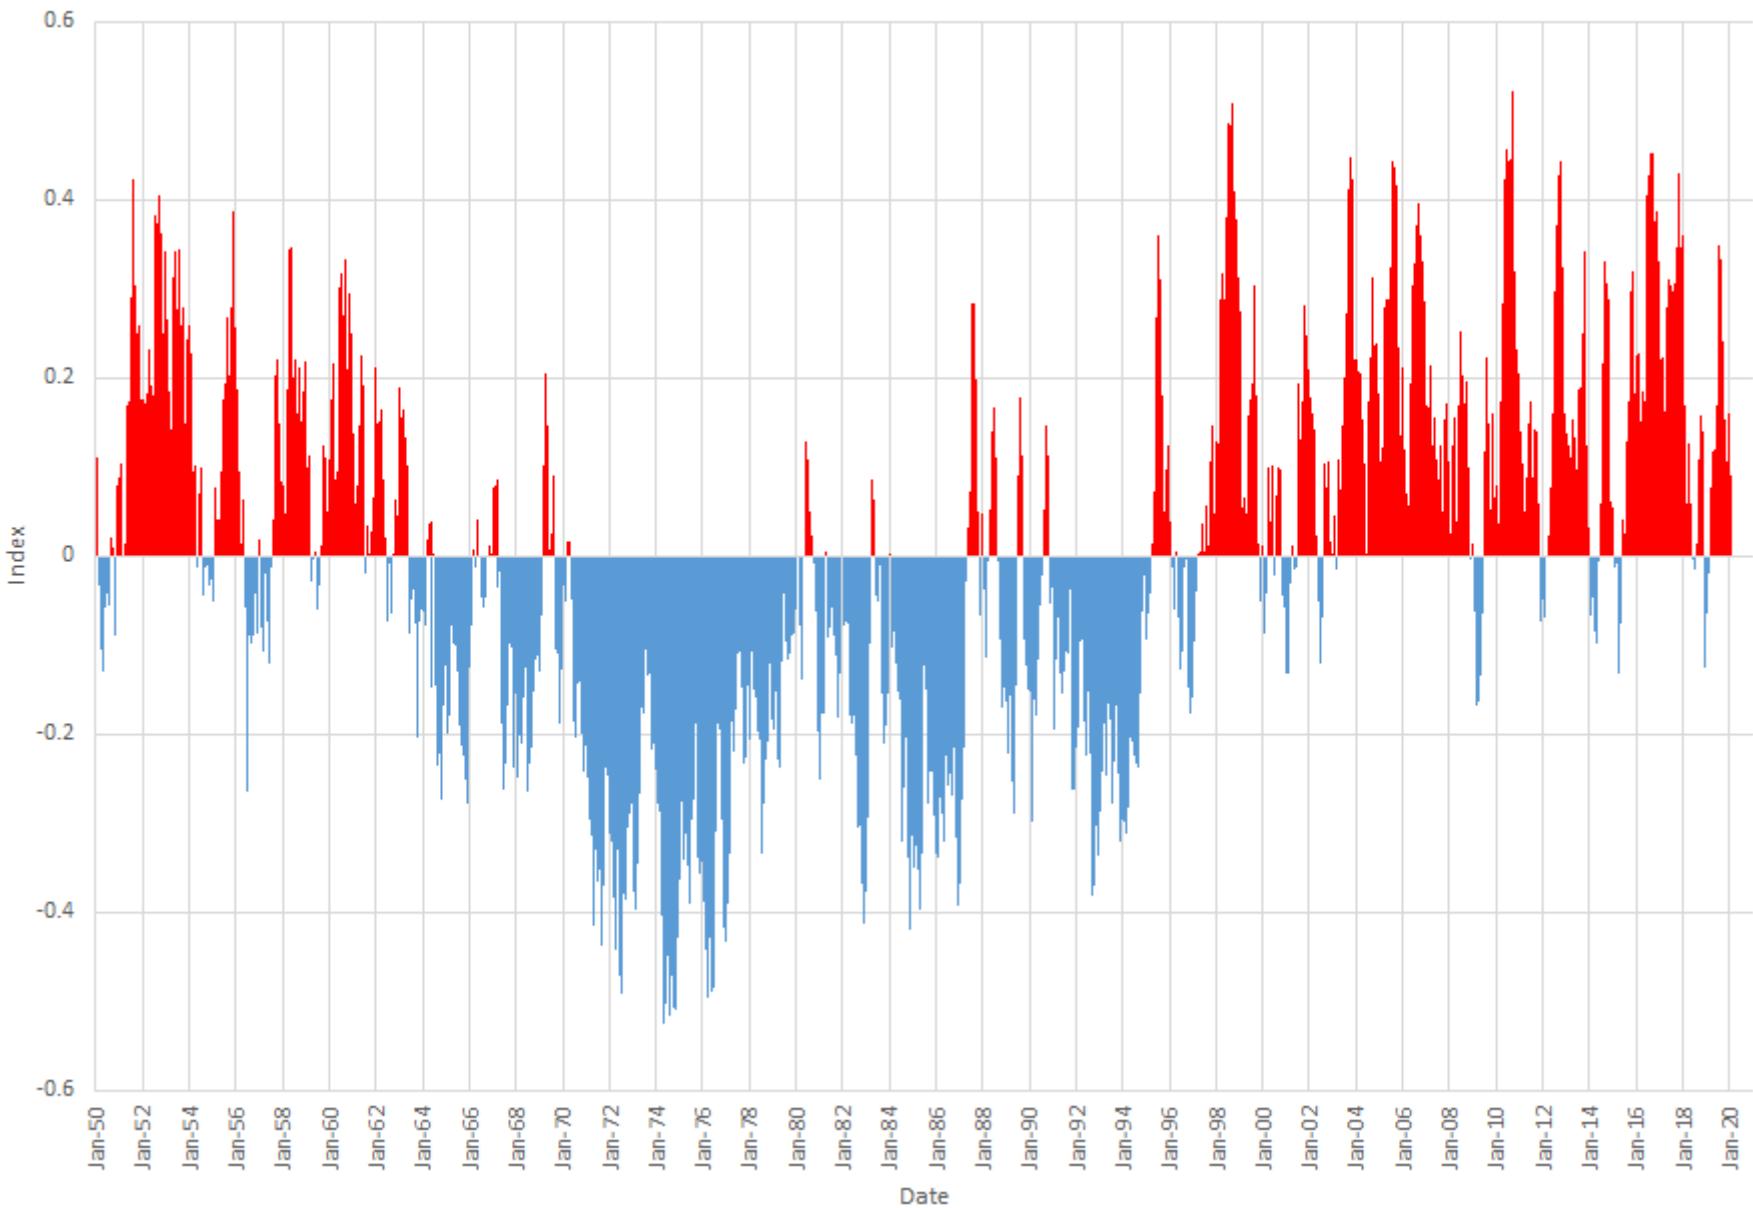

Updated: 13 February 2020

ENSO-neutral is most likely to continue through the Northern Hemisphere summer 2020.

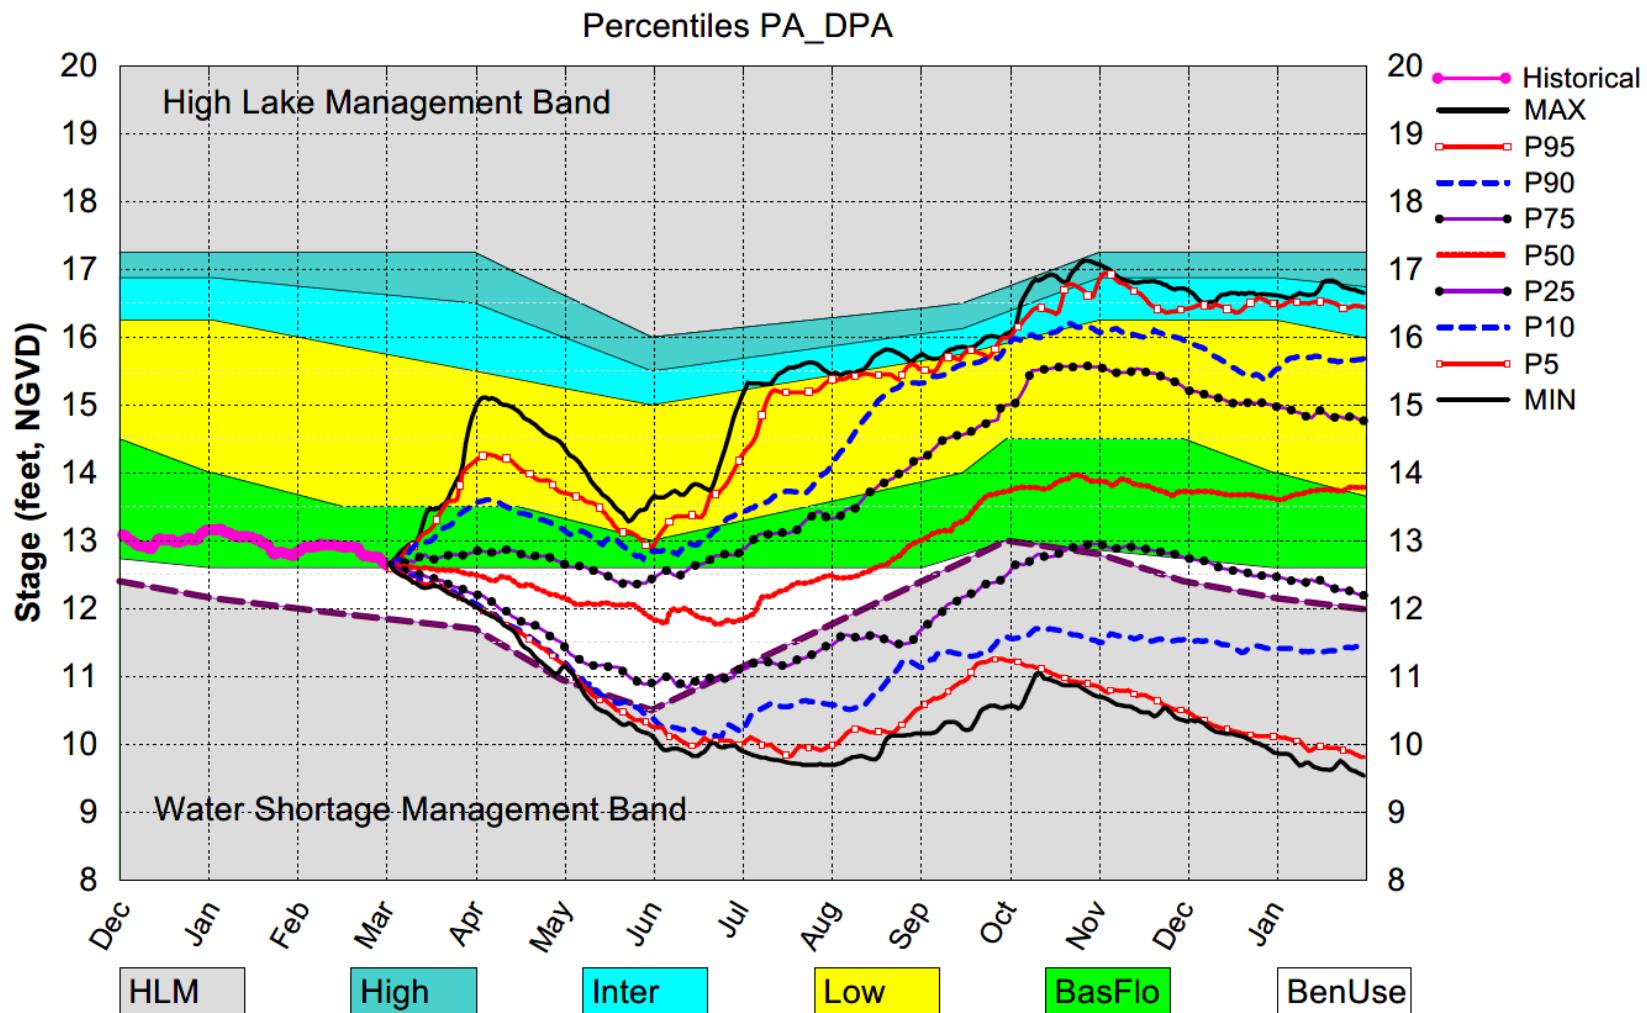

## Index of the North Atlantic Temperatures from Kaplan Extended SST V2

# Dynamic Position Analysis

- Based on historical climatic conditions spanning the period 1965-2005
- Each year the model resets the initial stages for Lake Okeechobee (LOK) and the Water Conservation Areas (WCAs) to value on the 1<sup>st</sup> of the previous month and conditions the simulation using real time data during the previous month to achieve real time stage on the 1<sup>st</sup> or 15<sup>th</sup> of the current month for both Lake Okeechobee and the Water Conservation Areas
- Dynamic Position Analysis
  - Each 1-year simulation starts with current hydrologic conditions (e.g., 1-March-2020)
  - 41 1-year simulations of system response to historical rainfall conditions
  - Statistical summaries used to display projections
