

## MEMORANDUM

**TO:** Laureen Borocharner, Chief, Engineering Division (USACE)  
**FROM:** John Mitnik, Chief District Engineer (SFWMD)  
Akin Owosina, Chief, Hydrology & Hydraulics Bureau (SFWMD)  
**DATE:** August 26, 2021  
**SUBJECT:** Operational Position Statement for August 24, 2021 to August 30, 2021

This Position Statement is to provide operational recommendations for the one-week period from August 24, 2021 to August 30, 2021 based on system conditions and data observed during the previous Monday to Sunday 7-day period. On August 23, Lake Okeechobee stage was 14.44 feet NGVD, which places it within the Low Sub-band of the 2008 Lake Okeechobee Regulation Schedule (LORS). Lake stage increased by 0.09 feet during the preceding 7 days.

August to date District rainfall is below normal (93% of normal). Rainfall forecast (issued August 24) predicts below average rainfall for the coming 7-day period and the second 7-day period.

Precipitation Outlook: The most recent CPC precipitation outlooks for September 2021 and for the 3-month windows of Sep-Nov and Oct-Dec are for equal chances of above-normal, normal, and below-normal rainfall. The 3-month windows of Nov 2021-Jan 2022 to Feb 2022-Apr 2022 indicate increased chances of below-normal rainfall. The outlooks for the 3-month windows transitioning into the 2022 wet season are mostly for slightly increased chances of above-normal rainfall.

2008 LORS Release Guidance (Part C): With Lake Okeechobee stage within the Low Sub-band, the Tributary Hydrologic Conditions in the Very Wet category and the Multi-seasonal Lake Okeechobee Net Inflow Outlook in the Normal category, Part C of the 2008 LORS suggests "Up to Maximum Practicable to the WCAs if desirable or with minimum Everglades impacts; otherwise no releases to WCAs."

Over the 7-day period from August 16, 2021 to August 22, 2021, no Lake Okeechobee releases were directed to the STAs. No Lake regulatory releases reached the Lake Worth Lagoon through the C-51 canal. Stage in WCA-1 is below regulation schedule in Zone A2, stage in WCA-2A is above schedule, and WCA-3A stage is below schedule (Zone B). For the coming operational period, the USACE is requesting maximum practical regulatory releases be sent south from Lake Okeechobee towards the WCAs.

2008 LORS Release Guidance (Part D): With Lake Okeechobee stage in the Low Sub-band, the Tributary Hydrologic Conditions in the Very Wet category, Lake Okeechobee stage more than 1 ft from the Intermediate Sub-band, and the Multi-seasonal Lake Okeechobee Net Inflow Outlook in the Normal category Part D of the 2008 LORS suggests "S-79 up to 450 cfs and S-80 up to 200 cfs".

For the 7-day period August 16, 2021 to August 22, 2021, total discharge to the St. Lucie Estuary was near 1,300 cfs with no flows coming from Lake Okeechobee. The 7-day average salinity at the US1 Bridge is in the fair range for adult oysters. Total inflow to the Caloosahatchee Estuary averaged approximately 3,950 cfs over the past week with no discharges coming from Lake Okeechobee. Salinity conditions are in the good range for Tape Grass at Val I-75 and at Ft. Myers. Salinity conditions for adult eastern oysters are in the good range at Shell Point and Sanibel, and in the poor range at Cape Coral.

The District will continue to work with the USACE to manage Lake Okeechobee levels in an effort to curtail harmful discharges over this year. Generally speaking, the District and Corps should strive to move as much water out of the lake without harming natural resources and other critical resources. At this time, this involves releases that maintain appropriate salinity in the estuaries and ensuring the Stormwater Treatment Areas don't sustain long term damage from extended high-volume flows. Current District operational objectives are to continue to move water south from Lake Okeechobee for delivery to the Everglades where opportunities exist.

The District recommends USACE continue lake discharges to the Caloosahatchee Estuary in a pulse release fashion, measured at S-79, at a non-damaging level of 1,000 cfs (7-day average), while continuing to monitor estuary conditions and make any adjustments as necessary. This decision should be reassessed as needed based on lake and estuarine conditions. The USACE typically implements the releases to the estuaries over a 7-day period starting on Saturday and ending on Friday.
