MEMORANDUM

TO: John Mitnik, Assistant Executive Director, Executive Office Staff

FROM: SFWMD Staff Environmental Advisory Team

DATE: April 2, 2025

SUBJECT: Weekly Environmental Conditions for Systems Operations

Summary

Weather Conditions and Forecast

A large mid-level ridge of high pressure over the western Atlantic is expected to strengthen over the next few days. As this system intensifies, the resulting pressure gradient will lead to breezy southeasterly winds of 15-20 mph along much of the east coast through Friday. By the weekend, the high pressure area is forecast to drift westward into Florida, gradually weakening the pressure gradient and easing the winds. At the same time, the strong subsidence and stabilizing influence of the high will dry the atmosphere, resulting in drier conditions with little to no rainfall this weekend. By early next week, a front may move through central Florida, leading to an increase in rainfall. Much below average total SFWMD rainfall is expected for the 7-day period ending next Tuesday morning.

Kissimmee

Releases were made as needed from East Lake Toho and Lake Toho to continue snail kite nesting season stage recessions to reach low pool by June 1, 2025. Weekly average discharge on March 30, 2025, was 360 cfs at S-65 and 310 cfs at S-65A, respectively. Mean weekly water depth on the Kissimmee River floodplain decreased by 0.04 feet to 0.22 feet. The weekly average concentration of dissolved oxygen in the Kissimmee River decreased from 7.8 mg/L the previous week to 7.4 mg/L, which is above both the potentially lethal level of 1.0 mg/L and the stressful level of 2.0 mg/L (**Figure KB-6**).

Lake Okeechobee

Lake Okeechobee stage was 11.25 feet NAVD88 (12.56 ft NGVD29) on March 30, 2025, which was 0.28 feet lower than the previous week and 1.21 feet lower than a month ago. Average daily inflows (excluding rainfall) were similar to the previous week at 300 cfs. Average daily outflows (excluding evapotranspiration) increased slightly from 4,750 cfs the previous week to 4,950 cfs. The most recent non-obscured satellite image from March 28, 2025, suggests low bloom activity in northern and western nearshore regions of Lake Okeechobee.

Estuaries

Total inflow to the St. Lucie Estuary averaged 672 cfs over the past week with 168 cfs flow coming from Lake Okeechobee. Surface salinities increased at all stations; bottom salinities decreased at the HR1 and US1 Bridge and increased at A1A Bridge sites. Salinity in the middle estuary was in the optimal range (10-25) for adult eastern oysters.

Total inflow to the Caloosahatchee Estuary averaged 1,508 cfs over the past week with 1,099 cfs coming from Lake Okeechobee. Salinities remained below 1 at S-79 and Val I-75. Salinities increased at all other sites in the estuary. Salinities were in the optimal range (0-10) for tape grass in the upper estuary. Salinities were within the optimal range (10-25) for adult eastern oysters at Cape Coral and Shell Point and in the upper stressed range (>25) at Sanibel.

Stormwater Treatment Areas

For the week ending Sunday, March 30, 2025, 22,700 ac-ft of Lake Okeechobee water was delivered to the FEBs/STAs. The total amount of Lake releases sent to the FEBs/STAs in WY2025 (since May 1, 2024) is approximately 310,000 ac-feet. The total amount of inflows to the STAs in WY2025 is approximately 1,180,000 ac-feet. STA cells are near or above target stage except STA-5/6 EAV cells that are below target stage. STA-1E Central Flow-way is offline for construction activities and STA-2 Flow-way 3 is offline for a SAV recovery drawdown. Operational restrictions are in effect in STA-1E Western Flow-way, STA-1W Northern Flow-way, STA-2 Flow-ways 2 and 4, and STA-3/4 Eastern Flow-way for vegetation management activities. This week, if LOSOM Recovery Operations to lower the lake level recommends Lake releases to the WCAs and conditions allow, releases will be sent to STA-2 and STA-5/6.

Everglades

Rates of stage change were fair to good over the last week across the WCAs and Northeastern Shark River Slough buffered by rainfall. WCA-3A—an important region for wading bird foraging as the dry season progresses—continues to experience recession rates that are too fast to maintain depths needed for wading bird foraging throughout the nesting season. WCA-3A North met the stage target of 9.4' NGVD29 at gauge 63 on March 15, 2025, shown to support nesting at the Alley North Colony, and conditions are currently favorable to support wood stork nesting effort. However, the current rate of dry-down is expected to result in deteriorating foraging conditions throughout the Everglades Protection Area (EPA). We expect poor stork and white ibis nesting success as below average depths and the rapid decline of suitable foraging habitat will most likely lead to nest abandonment. Slower recession rates in these areas would improve nesting prospects. Meanwhile, water depths in Taylor Slough and salinities in Florida Bay remain well-positioned for this point in the dry season. Florida Bay's minimum flows and levels (MFL) metrics also remain well outside of harmful thresholds.

Biscayne Bay

Total inflow to Biscayne Bay averaged 210 cfs, and the previous 30-day mean inflow averaged 135 cfs. The seven-day mean salinity was 28.2 at BBCW8 and 30.2 at BBCW10, both within the ideal salinity range for estuarine organisms in this region (salinity less than 35). Data were provided by Biscayne National Park.

Supporting Information

Kissimmee Basin

Upper Kissimmee

On March 30, 2025, mean daily lake stages were 55.0 feet NAVD88 (1.5 feet below schedule) in East Lake Toho, 51.9 feet NAVD88 (1.4 feet below schedule) in Lake Toho, and 48.3 feet NAVD88 (2.6 feet below the Increment 1 Temporary Deviation schedule) in Lakes Kissimmee-Cypress-Hatchineha (KCH) (**Table KB-1**, **Figures KB-1-3**).

Lower Kissimmee

For the week ending March 30, 2025, mean weekly discharge was 360 cfs at S-65 and 310 cfs at S-65A, respectively. Mean weekly discharge from the Kissimmee River was 310 cfs and 280 cfs at S-65D and S-65E, respectively (**Table KB-2**). Mean weekly headwater stages were 45.2 feet NAVD88 at S-65A and 24.5 feet NAVD88 at S-65D. Mean weekly river channel stage decreased by 0.1 feet to 30.9 feet NAVD88 (**Figure KB-4**). Mean weekly water depth on the Kissimmee River floodplain decreased by 0.04 feet to 0.22 feet (**Table KB-2**, **Figure KB-5**). The weekly average concentration of dissolved oxygen in the Kissimmee River decreased from 7.8 mg/L the previous week to 7.4 mg/L (**Table KB-2**, **Figure KB-6**).

Water Management Recommendations

Continue the stage recessions in East Lake Toho and Lake Toho lakes to reach their low pools on June 1, 2025. Follow the Headwaters Revitalization Schedule (HRS) Increment 1 Temporary Deviation Discharge Plan for S-65/S-65A (**Figure KB-7**). Maintain at least minimum flow (250-300 cfs) at S-65A.

Table KB-1. Average discharge for the preceding seven days, Sunday's average daily stage and Sunday's average daily departure from Kissimmee Chain of Lakes (KCOL) flood regulation lines or temporary schedules. All data are provisional.

Water Body	Structure	Stage Monitoring	Weekly (7-Day) Average Discharge (cfs)	Sunday Lake Stage (feet NAVD88) ^a	Schedule Type ^ь	Sunday Schedule Stage (feet NAVD88)	Sunday Departure from Regulation (feet)

Slide Revised 7/29/2024

10

Figure KB-7. Headwaters Revitalization Schedule (HRS) Increment 1 Temporary Deviation Discharge Plan for S-65/S-65A.

Lake Okeechobee

Lake Okeechobee stage was 11.25 feet NAVD88 (12.56 ft NGVD29) on March 30, 2025, which was 0.28 feet lower than the previous week and 1.21 feet lower than a month ago (**Figure LO-1**). Lake stage is in Zone D of the regulation schedule (**Figure LO-2**) and is in the recovery ecological envelope (**Figure LO-3**). According to NEXRAD, 0.57 inches of rain fell directly over the Lake during the previous week.

Average daily inflows (excluding rainfall) were similar to the previous week at 300 cfs. The largest single inflow came from the Kissimmee River via the S-65E structure (280 cfs). Average daily outflows (excluding evapotranspiration) increased slightly from 4,750 cfs the previous week to 4,950 cfs. **Figures LO-4 and LO-5** show the combined average daily inflows and outflows for the Lake over the past eight weeks, and average inflows and outflows last week, respectively.

In the most recent non-obscured satellite image from March 28, 2025, NOAA's Harmful Algal Bloom Monitoring System suggests low bloom activity in northern and western nearshore regions of Lake Okeechobee (**Figure LO-6**).

Note: All data presented in this report are provisional and are subject to change.

Figure LO-1. Lake Okeechobee water depth estimates based on South Florida Water Depth Assessment Tool (SFWDAT).

Lake Okeechobee Water Level History and Projected Stages

Figure LO-2. Recent Lake Okeechobee stages with projected stages based on a dynamic position analysis. Note: stages are in NGVD29, approximate NAVD88 values are shown for reference.

Figure LO-3. The current and seven prior year's annual stage hydrographs for Lake Okeechobee in comparison to the recovery envelope (light green). A shift from the normal ecological envelope to the recovery envelope occurred because the 30-day minimum lake stage (elevations exposed for at least 30 days, nonconsecutively) in the June 1 – July 31, 2023, window was >13 ft NGVD29 (11.75 ft NAVD88).

Figure LO-4. Major inflows (orange) to and outflows east and west (blue) from Lake Okeechobee. Outflows south are shown in green. Flows into Lake Okeechobee from the L-8 canal through S-271 (formerly Culvert 10A) or from the C-44 canal through the S-308 are included as inflows. Conversely, flows from Lake Okeechobee into the L-8 or C-44 canals are included with outflows. Inflows are shown as positive values; outflows are negative. Outflows through the S-77 (Caloosahatchee) and S-308 (C-44 Canal) structures are based on downstream gauges to include flows to lock openings for navigation.

Figure LO-5. Inflows into Lake Okeechobee from Indian Prairie basins, Taylor Creek/Nubbin Slough, Kissimmee River and Fisheating Creek, and outflows to the west via S-77, to the east via S-308, to the south via S-351, S-352, S-354, and to southeast via S-271 (formerly Culvert 10A) for the week of March 24 - 30, 2025.

Figure LO-6. Cyanobacteria bloom index level on Lake Okeechobee, based on NOAA's harmful algal bloom monitoring system. Gray color indicates cloud cover. *Provisional NOAA image, subject to change*.

Estuaries

St. Lucie Estuary

Over the past week, mean total inflow to the St. Lucie Estuary was 672 cfs (**Figures ES-1** and **ES-2**), and the previous 30-day mean inflow was 624 cfs. For comparison, the historical provisional mean inflows from the contributing areas are shown in **Figure ES-2**.

Over the past week, surface salinities increased at all sites (**Table ES-1** and **Figure ES-3**). The seven-day moving average of the surface and bottom salinities at the US1 Bridge was 14.1. Salinity conditions in the middle estuary were estimated to be within the optimal range for adult eastern oysters (**Figure ES-4**). The mean larval oyster recruitment rate reported by the Fish and Wildlife Research Institute (FWRI) was 0 spat/shell, indicating spawning in the SLE has not started as of late February (**Figure ES-5**).

Caloosahatchee River Estuary

Over the past week, mean total inflow to the Caloosahatchee River Estuary was 1,508 cfs (**Figures ES-6** and **ES-7**), and the previous 30-day mean inflow was 1,965 cfs. For comparison, the historical provisional mean inflows from the contributing areas are shown in **Figure ES-7**.

Over the past week, surface salinities remained below 1 at S-79 and Val I-75 and increased at all other sites within the estuary (**Table ES-2** and **Figures ES-8** and **ES-9**). The seven-day mean salinities (**Table ES-2**) were in the optimal range (0-10) for tape grass in the upper estuary. The seven-day mean salinity values were within the optimal range for adult eastern oysters at Cape Coral and Shell Point and in the upper stressed range at Sanibel (**Figure ES-10**). No oyster spat recruitment was found by the FWRI at either Iona Cove or Bird Island, indicating spawning has not started at these locations as of late February (**Figures ES-11 and ES-12**).

Surface salinity at Val I-75 was forecast for the next two weeks using an autoregression model (Qiu and Wan, 2013¹) coupled with a linear reservoir model for the tidal basin. Model scenarios included pulse releases at S-79 ranging from 450 to 2,000 cfs with estimated tidal basin inflows of 68 cfs. Model results from all scenarios predict daily salinity to be 0.9 or lower and the 30-day moving average surface salinity to be 0.5 or lower at Val I-75 at the end of the two-week period (**Table ES-3** and **Figure ES-13**). This keeps predicted salinities in the upper estuary within the optimal salinity range (0-10) for tape grass.

¹ Qui, C., and Y. Wan. 2013. Time series modeling and prediction of salinity in the Caloosahatchee River Estuary. *Water Resources Research* 49:5804-5816.

Red Tide

The FWRI reported on March 28, 2025, that *Karenia brevis*, the Florida red tide dinoflagellate, was not observed at bloom concentrations in any samples collected within the District region over the past week.

Water Management Recommendations

Lake stage is in Zone D. Current climatological and hydrological conditions are normal. The LOSOM release guidance suggests up to 2,100 cfs release at S-79 to the Caloosahatchee River Estuary and up to 1,400 cfs total to S-80, S-97, S-49, and Gordy Road combined to the St. Lucie Estuary.

Figure ES-1. Basins, water control structures and salinity monitoring sites in the St. Lucie Estuary.

Figure ES-2. Total daily inflows from Lake Okeechobee and runoff from the C-44, C-23, C-24, Ten Mile Creek, and Tidal Basins into the St. Lucie Estuary.

Table ES-1. Seven-day mean salinity at oyster monitoring sites in the St. Lucie Estuary. Current means are in bold font; previous week's means are in parentheses. The envelope reflects the optimum salinity range for adult eastern oysters (*Crassostrea virginica*) in the estuary. Data are provisional.

Sampling Site	Surface	Bottom	Optimum Envelope
HR1 (North Fork)	9.4 (8.2)	10.7 (11.3)	10.0 – 25.0
US1 Bridge	14.6 (13.3)	13.7 (14.9)	10.0 – 25.0
A1A Bridge	22.7 (18.9)	26.4 (24.6)	10.0 - 25.0

Figure ES-3. Mean daily salinity at the A1A, US1, and HR1 sites in the St. Lucie Estuary.

Figure ES-4. Seven-day moving average of the surface and bottom salinities at the US1 Bridge in the St. Lucie Estuary.

Figure ES-5. Mean oyster recruitment at the Rio oyster monitoring station and 14-day mean salinity at US1 Bridge.

Figure ES-6. Basins, water control structures, and salinity monitoring sites in the Caloosahatchee River Estuary.

Figure ES-7. Total daily inflows from Lake Okeechobee, and runoff from the C-43 and Tidal basins into the Caloosahatchee River Estuary.

Table ES-2. Seven-day mean salinity at six monitoring sites in the Caloosahatchee River Estuary. Current means are in bold font; previous week's means are in parentheses. The envelope in the upper estuary sites is for the protection of tape grass and the envelope in the lower estuary is the optimum salinity range for adult eastern oysters (*Crassostrea virginica*). Data are provisional.

Sampling Site	Surface	Bottom	Optimum Envelope
S-79 (Franklin Lock)	0.2 (0.2)	0.2 (0.2)	0.0 - 10.0
Val I-75	0.3 (0.2)	0.4 (0.2)	0.0 - 10.0
Fort Myers Yacht Basin	3.7 (0.8)	5.2 (2.0)	0.0 - 10.0
Cape Coral	11.1 (8.6)	13.7 (11.4)	10.0 - 25.0
Shell Point	26.6 (23.6)	23.4 (23.4)	10.0 – 25.0
Sanibel	30.4 (28.5)	31.6 (30.6)	10.0 – 25.0

Stormwater Treatment Areas

STA-1E: STA-1E Central Flow-way is offline for construction activities. An operational restriction is in place in the Western Flow-way for post-construction vegetation grow-in. Online treatment cells are near target stage. The 365-day PLR for the Western Flow-way is below 1.0 g/m²/year (**Figure S-2**).

STA-1W: An operational restriction is in place in the Northern Flow-way for vegetation management activities. Treatment cells are near target stage. Vegetation in the Western and Eastern flow-ways is highly stressed. The 365-day PLR for the Eastern Flow-way is below 1.0 g/m²/year. The 365-day PLRs for the Western and Northern Flow-ways are high (**Figure S-2**).

STA-2: STA-2 Flow-way 3 is offline for a SAV recovery drawdown. Operational restrictions are in place in Flow-ways 2 and 4 for vegetation management activities. Online treatment cells are near target stage. Vegetation in Flow-ways 2 is stressed, and in 5 is highly stressed. The 365-day PLRs for Flow-ways 1, 4, and 5 are below 1.0 g/m²/year. The 365-day PLR for Flow-way 2 is high (**Figure S-3**).

STA-3/4: An operational restriction is in place in the Eastern Flow-way for post-drawdown vegetation grow-in. Treatment cells are near or above target stage. Vegetation in the Central Flow-way is highly stressed. The 365-day PLR for the Eastern Flow-way is below 1.0 g/m²/year. The 365-day PLRs for the Central and Western Flow-ways are high (**Figure S-3**).

STA-5/6: Treatment cells are near or below target stage. All treatment cells have highly stressed or stressed vegetation conditions. The 365-day PLRs for Flow-ways 1, 2, 6, 7, and 8 are below 1.0 g/m²/year, and the 365-day PLRs for Flow-ways 3, 4, and 5 are high. (**Figure S-4**).

For definitions on STA operational language see glossary following figures

Everglades Stormwater Treatment Areas - STAs

- Total WY2025 inflows to STAs (5/1/2024 to 3/30/2025): ~1,180,000 ac-ft
- Lake Okeechobee releases to FEBs/STAs
 - 3/24/2025 to 3/30/2025: ~22,700 ac-ft
 - WY2025: ~310,000 ac-ft
- Extensive vegetation management activities underway to address stressed and highly stressed vegetation in EAV cells
- Most treatment cells are near or above target water depth except STA-5/6 EAV cells which are below target

Figure S-4. Western Flow Path Weekly Status Report

Basic Concepts and Definitions for STA Weekly Status Report

- · Inflow: Sum of flow volume at all inflow structures to an STA.
- Lake Inflow: Portion of the STA total inflow volume that originates from Lake Okeechobee.
- · Outflow: Sum of flow volume at outflow structures from an STA.
- · Total Phosphorus (TP): Total mass of phosphorus in all its forms; including particulate, dissolved, etc.
- Inflow Concentration: TP concentration is the mass of TP in micrograms per liter of water, μg/L or ppb. Inflow concentration refers to the flowweighted mean TP from all inflow structures over a period of time.
- Outflow Concentration: The flow-weighted mean TP from all outflow structures over a period of time. The outflow concentration represents the reduction of inflow TP achieved by STA treatment of the inflow water.
- WQBEL: The STA outflow concentration that is required upon completion of the Restoration Strategies projects by December 2025. The outflow
 concentration shall not exceed 13 ppb as an annual flow weighted mean in more than 3 out of 5 water years on a rolling basis and shall not exceed
 19 ppb as an annual flow weighted in any water year.
- Flow-Way (FW): One or more treatment cells connected in series. Cells typically have emergent aquatic vegetation (EAV) in the front portion of the flow-way followed by a mix of EAV and submerged aquatic vegetation (SAV)
- Vegetation Status: Healthy means the vegetation condition is good and will allow the STA to perform as designed. Stressed means the vegetation is showing signs of poor health, such as browning or areas of vegetation die-off, or the cell contains undesirable vegetation such as floating exotic vegetation requiring treatment. The TP reduction capability of the STA is affected when the vegetation condition is poor.
- Phosphorus Loading Rate (PLR): Mass of inflow TP in grams, divided by total treatment area of STA in square meters, per year. In general, a 365day value of less than 1.0 is needed for an STA to perform optimally. A PLR of 2.0 is considered very high and a PLR of 3.0 is considered extremely high. The TP reduction capability of the STA is affected when the PLR is high, very high and extremely high.
- Online: Online status means the FW can receive and treat inflow.
- Online with Restriction: The FW can receive and treat inflow, but the amount of flow or water level may be limited temporarily. For example, a
 vegetation rehabilitation effort may require reduced flows through an area while the new plants are establishing, or nesting by protected species
 may require a certain water level not to be exceeded.
- · Offline: The FW is unable to receive and treat inflow due to repairs, construction, or other prohibitive reasons.
- Depth: Difference between the average surface water level in a cell and the average ground elevation in that cell. Target depths, or depths between flow events, are between 1.25 ft to 1.5 ft. As depth approaches or drops below zero, an increasing percentage of the cell is considered dry and STA conditions deteriorate. An increase in depth above target depth is expected with increasing flow. However, as depth increases much above the target depth and is sustained over a period of time, it can be detrimental to vegetation health and overall STA treatment performance.
- Note: The data provided in this summary report were developed using a combination of provisional and quality-assured flow and water quality data. In some cases, best professional judgment was used to estimate missing data and revise questionable data. Values provided are not considered final but are appropriate for use in STA operational decision-making.

Everglades

Water Conservation Area

Regulation Schedules

Above average rainfall occurred throughout the Everglades Protection Area (EPA) resulting in a decrease in recession rates in all regions except in the northwest of WCA-3A. WCA-1: Stage remained just below the A1 zone regulation line in the Refuge with the 1-8C gauge below by 0.25 feet on Sunday, March 30, 2025. WCA-2A: Stage recession continues at gauge S11B and on Sunday was 0.18 feet below the Zone A line. WCA-3A: The 3 Gauge Average recession rate continues to recede at a rate faster than the slope of the Zone A line with a slight uptick at the end of the week, stages were below the regulation line by 0.93 feet on Sunday. WCA-3A North: Stage at Gauge 62 (NW corner) continues to recede away from the regulation line and was 1.48 feet below the Upper Schedule on Sunday. See figures **EV-1** through **EV-4**.

Water Depths

The SFWDAT model output for March 30, 2025, indicates an increase in shallower conditions across the northern portions of all WCAs over the last three months. WCA-3A North is now near complete dry out except in the southeast corner near the Alley North colony. The ponded conditions in southern WCA3A remain absent and that region is now well below average stage. Most of the Big Cypress Basin is now below soil surface, significantly so near the Tamiami trail. Hydrologic connectivity within the sloughs of Everglades National Park (ENP) are diminishing, Shark River Slough and Taylor slough are drying down as dry season conditions progress. Conditions are currently very dry compared to the 20-year average, with all of WCA-3A South and significant portions of WCA-1 and WCA-2 now approaching the 10th percentile. See figures **EV-5** through **EV-6**.

Taylor Slough and Florida Bay

Most stages across Taylor Slough increased over the past week, with an average increase of 0.31 feet. Data were missing from several stations but of the data available, changes ranged from -0.03 feet at EPSW in the C-111 area to +0.93 feet at E112 in the northern slough (**Figure EV-7 and Figure EV-8**). Taylor Slough water levels remain above the recent average (WY1993-2016) for this time of year by 6.7 inches compared to before the Florida Bay initiative (starting in 2017), an increase of 6.4 inches relative to last week's comparison.

Average Florida Bay salinity was 31.5, an increase of 0.6 from last week. Salinity changes ranged from -1.4 at Joe Bay (JB) to +2.4 at Little Madeira Bay (LM), both in the eastern nearshore region (**Figure EV-8**). Salinity is above the estimated average for 1900 and within the WY2001-2016 Interquartile Range (IQR) in all three regions (**Figure EV-9**). Average Florida Bay salinity remains just above its recent average (WY1993-2016) for this time of year by 0.7, an increase of 0.4 relative to last week's comparison.

Salinity at the Taylor River (TR) station in the mangrove zone (tracked for the Florida Bay MFL) was 2.7. The 30-day moving average was 9.9 (**Figure EV-10**), an increase of 0.4 from last week. The 365-day moving sum of flow from the five major creeks (McCormick Creek, Taylor River, Mud Creek, Trout Creek, West Highway Creek) was 267,355 acrefeet, a decrease of 16,935 acre-feet from last week (**Figure EV-10**).

Average rainfall across Taylor Slough and Florida Bay was 0.58 inches over the past week, based on the 15 gauges used for this report. Rainfall ranged from 0.01 inches at LM in the eastern nearshore region to 1.97 inches at Taylor Slough Bridge (TSB) in the northern slough (**Figure EV-11**). Wind directions and speeds in Florida Bay ranged from 0.2 mph W on March 25th to 29.6 mph E on March 29th (**Figure EV-11**).

Average daily flow from the five major creeks totaled 109 acre-feet, with net positive flows over the past week. Total daily creek flow ranged from -1,099 acre-feet on March 30th to 932 acre-feet on March 27th (**Figure EV-12**). Average daily flow was 3,137 acre-feet below estimated historical levels (circa 1900).

Implications for water management

The ecology of the Everglades benefits from recession rates from 0.0 to 0.12 feet per week this time of year, with an ecologically ideal rate near 0.06 given the ongoing drier than average rainfall amounts that are predicted. Maintaining a hydroperiod supportive of wading bird nesting at the Alley North colony in WCA-3A North is critical to the overall ecology of the region. A concern for wading bird nesting are the conditions in WCA-3A South where stages are quickly approaching the soil surface; hydroperiods that stretch into the late dry season in this region are very beneficial in sustaining wading bird foraging and nesting in the EPA. Florida Bay salinity is at a good position as we continue into the dry season and will continue to benefit from maintaining freshwater input to the system when available. Maintaining higher water depths by increasing inflow and minimizing outflow of WCA-3A can be beneficial to the success of wading bird nesting in the EPA. Conserving water in WCA-3A might be a concern if Florida Bay salinities are seen to rise rapidly and approach hypersalinity. The current favorable salinity levels in Florida Bay may provide an opportunity to deliver broader landscape-wide ecological benefits across the EPA while balancing ecological priorities. Individual regional recommendations can be found in Table EV-2.

Everglades Region	Rainfall (inches)	Stage change (feet)
WCA-1	0.91	-0.05
WCA-2A	0.79	-0.03
WCA-2B	1.29	-0.06
WCA-3A	0.74	-0.05
WCA-3B	1.04	-0.06
ENP	1.33	-0.10

Table EV-2. Weekly water depth changes an	d water management recommendations
---	------------------------------------

SFWMD Everglades Ecological Recommendations, April 4, 2025 (red is new)				
	Weekly change	Recommendation	Reasons	
WCA-1	Stage decreased by 0.05 feet	Recession rate of less than 0.06 feet per week.	Protect within basin and downstream habitat and wildlife. Preserving suitable wading bird foraging habitat throughout the nesting season.	
WCA-2A	Stage decreased by 0.03 feet	Recession rate of less than 0.06 feet per week.	Protect within basin and downstream habitat and wildlife. Preserving suitable wading bird foraging habitat throughout the nesting season.	
WCA-2B	Stage decreased by 0.06 feet	Recession rate of less than 0.12 feet per week.	Protect within basin and downstream habitat and wildlife.	
WCA-3A NE	Stage increased by 0.01 feet	Recession rate of less than 0.06 feet per week.	Protect within basin and downstream habitat and wildlife.	
WCA-3A NW	Stage decreased by 0.13 feet	Recession rate of less than 0.06 feet per week.	foraging habitat throughout the nesting season.	
Central WCA-3A S	Stage decreased by 0.04 feet	Recession rate of less than 0.06 feet per week.	Protect within basin and downstream habitat and wildlife. Preserving suitable wading bird	
Southern WCA-3A S	Stage decreased by 0.02 feet		foraging habitat throughout the nesting season.	
WCA-3B	Stage decreased by 0.06 feet	Recession rate of less than 0.12 feet per week.	Protect within basin wildlife.	
ENP-SRS	Stage decreased by 0.10 feet	Make discharges to ENP according to COP and TTFF protocol while adaptively considering upstream and downstream ecological conditions.	Protect within basin and upstream habitat and wildlife.	
Taylor Slough	Stage changes ranged from -0.03 feet to +0.93 feet	Move water southward as possible.	When available, provide freshwater to promote water movement.	
FB- Salinity	Salinity changes ranged from -1.4 to +2.4	Move water southward as possible.	When available, provide freshwater to promote water movement.	

Biscayne Bay

As shown in **Figure BB-1**, mean total inflow to Biscayne Bay was 210 cfs, and the previous 30-day mean inflow was 135 cfs. The seven-day mean salinity was 28.2 at BBCW8 and 30.2 at BBCW10, both within the ideal salinity range for estuarine organisms in this region (salinity less than 35). Data were provided by Biscayne National Park.

Figure BB-1. Seven-day mean salinity at BBCW8 and BBCW10 and total daily flow in Biscayne Bay. Total daily flow was calculated using flow from structures S20G, S20F, S21, S21A, S123, and S700P.
