

These South Florida Water Management District data layers are streamed live to Google Earth beginning seconds after you stop changing the view. The data is updated once per day. The farther you are zoomed out, the more data will be streamed and the longer it will take to redraw in Google Earth.

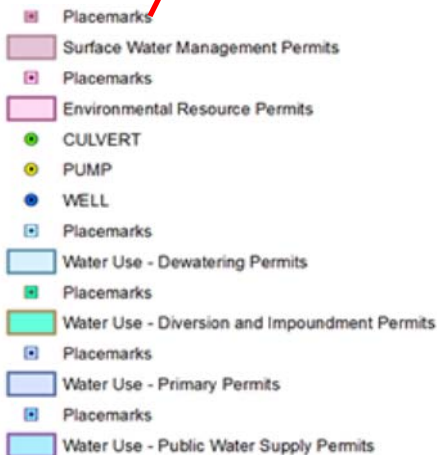

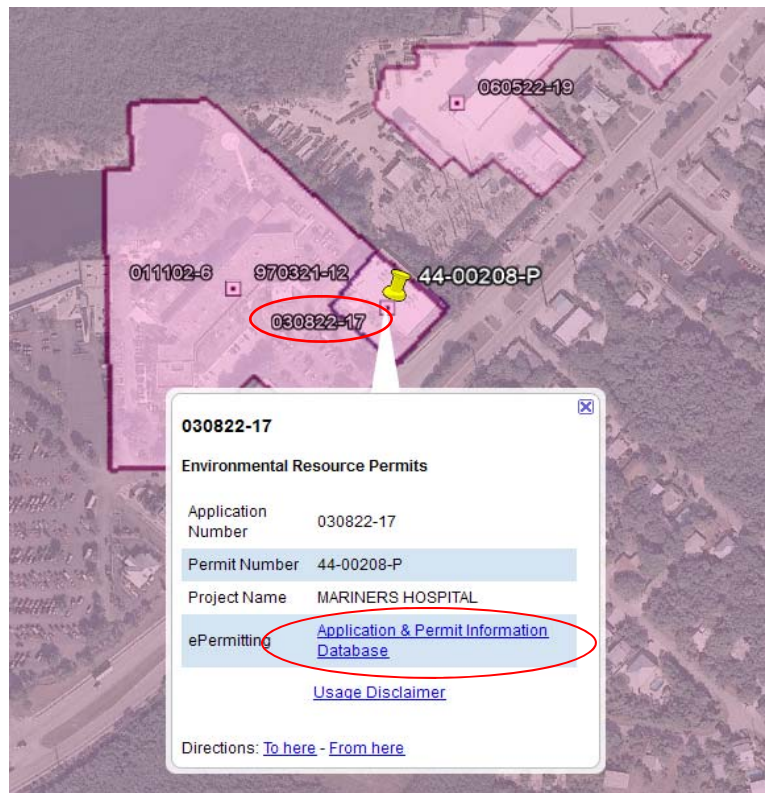

- When Google Earth is accessed for the first time, only the data layers initially searched for will be populated.
- Check/uncheck boxes to turn on/off additional data layers. To best view permitting data, turn off all unnecessary layers in the “Layers” menu.
- To turn on all data layers, select “Live Database.” *Note: Recommend only selecting all data layers if you are zoomed into a small geographical area.*

• Click the +/- buttons to expand or collapse selections.  
*Example: Clicking on the main Environmental Resource Permits folder turns on both ERP and SWM permits.*

- For application/permit information, hover over and click on the square symbols. For additional information, click “Application & Permit Information Database.”

- To save data layers for future use, choose to save information to your “My Places” folder when prompted before exiting. The data layers will be available the next time Google Earth is accessed.
- To search for additional applications/permits, scroll to surrounding areas or enter a physical address in the Google Earth search criteria. To search by application/permit number, visit the ePermitting home page at [www.sfwmd.gov/ePermitting](http://www.sfwmd.gov/ePermitting).
