Summary

- The Climate Prediction Center (CPC) is forecasting increased chances (33%-40%) of above-normal rainfall for July through September.
- ENSO-neutral conditions are present. La Niña is favored to develop during summer 2016 with about a 75% chance of La Niña during the fall and winter 2016-17.
- The strong positive phase of the Pacific Decadal Oscillation increases the potential for a greater number of El Niño events for multi-year periods.
- Watching Atlantic Multidecadal Oscillation (AMO) index for switch to negative (cold) phase, this has the potential to contribute to a drier-than-normal 2016 wet season. Good indicator of switch to the cold phase will be an average to below-average hurricane season.

U. S. Seasonal Outlooks

July - September 2016

The seasonal outlooks combine the effects of long-term trends, soil moisture, and, when appropriate, ENSO.

Niño Region SST Departures (°C) Recent Evolution

The latest weekly SST departures are:

Niño 4	0.3°C
Niño 3.4	-0.4°C
Niño 3	-0.4°C
Niño 1+2	0.2°C

Data updated through May 2016

Weekly Heat Content Evolution in the Equatorial Pacific

Downwelling phases of equatorial oceanic Kelvin waves were observed in July-August, October to November, and January-February 2016.

Since the passage of an upwelling equatorial oceanic Kelvin wave in March 2016, below-average subsurface temperatures have persisted across much of the equatorial Pacific.

Equatorial oceanic Kelvin waves have alternating warm and cold phases. The warm phase is indicated by dashed lines. Downwelling and warming occur in the leading portion of a Kelvin wave, and up-welling and cooling occur in the trailing portion.

IRI/CPC Pacific Niño

3.4 SST Model Outlook

The dynamical model average indicates La Niña by June-July-August (JJA) while the statistical models predict a transition around September-October-November (SON) 2016.

Figure provided by the International Research Institute (IRI) for Climate and Society (updated 16 June 2016).

Historical El Niño and La Niña Episodes Based on the ONI computed using ERSST.v4

Recent Pacific warm (red) and cold (blue) periods based on a threshold of ± 0.5 °C for the Oceanic Nino Index (ONI) [3 month running mean of ERSST.v4 SST anomalies in the Nino 3.4 region (5N-5S, 120-170W)]. For historical purposes, periods of below and above normal SSTs are colored in blue and red when the threshold is met for a minimum of 5 consecutive over-lapping seasons.

The ONI is one measure of the El Niño-Southern Oscillation, and other indices can confirm whether features consistent with a coupled ocean-atmosphere phenomenon accompanied these periods. The complete table going back to DJF 1950 can be found [here](#).

Year	DJF	JFM	FMA	MAM	AMJ	MJJ	JJA	JAS	ASO	SON	OND	NDJ

2016	2.2	1.9	1.5	1.1	0.7							

*CPC considers El Niño or La Niña conditions to occur when the monthly Niño3.4 OISST departures meet or exceed ± 0.5 °C along with consistent atmospheric features. These anomalies must also be forecasted to persist for 3 consecutive months.

CPC/IRI Probabilistic ENSO Outlook

Updated: 9 June 2016

La Niña is slightly favored by June-July-August (JJA) 2016. The chance of La Niña is roughly 75% during the Northern Hemisphere fall and winter 2016-17.
