## C-111 South Dade Project

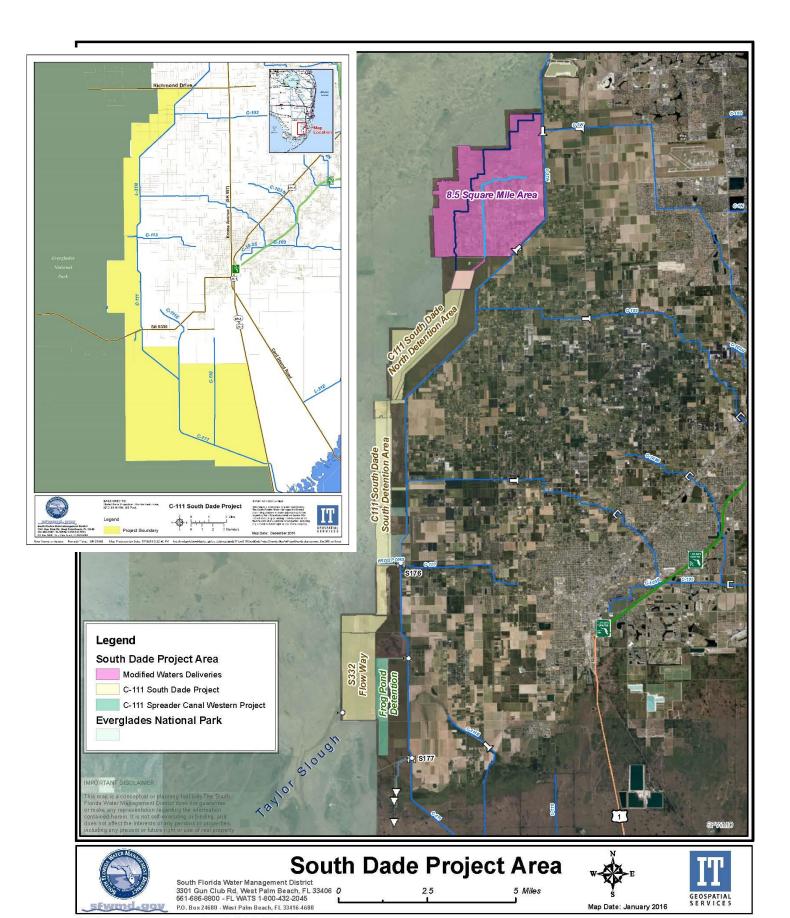

The C-111 South Dade Project in south Miami-Dade County is a partnership between the South Florida Water Management District and the U.S. Army Corps of Engineers. The project benefits the Taylor Slough basin as well as agricultural and urban lands. The \$300 million invested in project costs and land purchases will help restore critical ecosystems in the area and prevent groundwater from seeping out of Everglades National Park.

### **Project goals**

- Connect the C-111 South Dade Project to the Modified Waters Deliveries to Everglades National Park Project
- Restore natural water conditions in Taylor Slough
- Restore and preserve thousands of acres of land critical to balancing the need for flood protection and ecosystem restoration
- Create a hydraulic barrier that prevents freshwater seeping out of Everglades National Park into nearby farmland
- Allow more water to flow into Everglades National Park including Florida Bay to restore natural salinity levels

## **Current and Future Project Components**

- Seven of the project's components have already been constructed.
- About 41,000 acres of land have been purchased by the South Florida Water Management District at a total cost of \$133 million for restoration. Another 500 acres are in the process of being purchased.
- The remaining components to be constructed include the removal of two pump stations and two spillways; the construction of flow ways; and plugs or fills in the western portion of the L-32 canal.
- The North Detention Area is also being built by the U.S. Army Corps of Engineers. This will connect the C-111 South Dade Project to the Modified Waters Deliveries to Everglades National Park Project.
- Several pump stations along the South Detention Area are currently being operated by the South Florida Water Management District.
