

## Land Use 1992

Approximate South Florida land use and canal/levee in 1992 (30x30 m cell resolution) (Florida Dept. of Transportation). The classification scheme used in this map is shown only for very general inter-decadal comparisons, as it does not distinguish among natural marsh vegetation types, and is not currently being used in the modeling efforts. Ongoing remote sensing work by has produced ground-truthed vegetation maps for most of the greater Everglades (for use in modeling and other analytic efforts).
