Quality Assessment Report for Water Quality Monitoring

January - March 2007

Submitted to the Technical Oversight Committee (TOC) on April 15, 2007

Zdzislaw Kolasinski (zkolasin@sfwmd.gov), John Moorman (jmoorma@sfwmd.gov)
Introduction

This report is an assessment of the South Florida Water Management District (District) laboratory analysis and field sampling for Total Phosphorus (TP) monitoring, primarily for the following projects/stations during the first quarter of 2007.

- Conservation Area Inflow and Outflows (CAMB) S12A, S12B, S12C S12D, S333
- Everglades National Park Inflow Monitoring (ENP) S174, S176, S177, S18C, S332D
- Everglades Protection Area (EVPA) LOX3 to LOX16
- Non-Everglades Construction Project (NECP) S334

Since field QC samples are collected for trips that include multiple project samples for the stations of interest, the report may also cover information on stations or projects other than those in this list.

Data from stations S175 and S332 are not included in the Field Sampling Quality Assessment section of this report. These stations are not included in the list of compliance stations for the TOC.

The District’s Field Sampling Quality Manual provides the minimum requirements followed in field sample collection. The Laboratory Quality Manual provides the minimum requirements for preparing and analyzing laboratory samples, as well as verifying and validating data. Field Sampling Quality Assessment and Laboratory Analysis Quality Assessment in this report provide results of laboratory and field quality control during this quarter.

The SFWMD laboratory (LIMS) provided the data used in this report. Consider this data preliminary until the District releases it to their main database (DBHYDRO).

The criteria used for data validation qualifying of blanks were changed, based on clarification from Florida Department of Environmental Protection (FDEP). Blanks with values equal to or greater than the MDL are qualified. This is a change from only qualifying blanks greater than the MDL value.

This report includes an analysis of the District laboratory’s performance on split and inter-laboratory studies with FDEP and other laboratories for three selected projects (EVPA, C111 and Everglades TP Round Robins) for a one-year period. The results of the U.S. Geological Survey Analytical Evaluation Program for Standard Reference Samples and the National Water Research Institute Environment Canada, Inter-laboratory Proficiency Testing Program are also included.
PROCEDURE UPDATES

This period had no major procedural updates related to TP collection.

FIELD AUDIT

Field audits were not conducted on TOC related projects during the first quarter of 2007.

MISSING DATA

Table 1 shows a list of missing data for this reporting period. Data may not be available due to problems with field collection or with sample submission to the laboratory. Out of 15 missing data, 13 were not collected due to either lack of flow, structure maintenance or shallow water depth. The laboratory cancelled an analysis for one sample collected at S333 because of improper sample preservation. In addition, the laboratory did not receive one collected sample.

Table 1. Missing data for the period from 01/01/07 to 03/31/07.

QUALITY CONTROL

Field QC measures consist of Equipment Blanks (EB), Field-Cleaned Equipment Blanks (FCEB), Field Blanks (FB), Split Samples (SS) and Replicate Samples (RS). Table 2 summarizes EB, FB and FCEB results for all projects of interest to the TOC. Two blanks associated with samples for the stations listed in Section I were outside the acceptance criterion. Table 3 summarizes the field precision results and shows that the field sampling precision was acceptable for all three projects. Routinely, data not meeting the set criteria for blanks, field precision or sampling protocols are flagged using FDEP data qualifier codes. Table 4 lists data flagged for all trips that include samples for CAMB, ENP, EVPA and NECP projects during this quarter.

Table 2. Field and equipment blank results 1, 2, 3, 4.

1 Only blanks for sampling events from samples collected at stations listed in Section I of this report were included in this analysis.
2 Blanks for TP, which were associated with a short-term autosampler project at some TOC stations, were not included in this analysis.
3 FB, FCEB and EB acceptance criteria must be < MDL.
4 When sample concentrations are less than five times the resulting blank values, laboratory personnel flagged the samples for possible contamination.

Quality Assessment Report for Water Quality Monitoring  Laboratory Analysis Quality Assessment

Laboratory Analysis Quality Assessment

PROCEDURE UPDATES

The Quality Control Solution (LCS3) concentration in the TP analytical procedure was changed from 0.030 mg/L to 0.020 mg/L.

LABORATORY QUALITY CONTROL

Routine laboratory QC samples include QC checks, matrix spikes, and precision checks. Figure 1 through Figure 4 show recoveries from various types and levels of QC samples for the TP analysis at the District laboratory from January 1 through March 31, 2007.

![Figure 1. QC (Laboratory Control Solution) sample recoveries for TP analysis.](image1)

Mean = 99.8%, Max = 105.0%, Min = 95.7%

![Figure 2. QC (Laboratory Control Solution) sample recoveries for TP analysis.](image2)

Mean = 98.6%, Max = 106.7%, Min = 90.0%
Mean = 100.3%, Max = 104.0%, Min = 98.0%

**Figure 3.** QC (Continuing Calibration Verification) sample recoveries for TP analysis.

Mean = 101.8%, Max = 125.0%, Min = 75.0%

**Figure 4.** QC5 (Method Detection Limit check) sample recoveries for TP analysis.
Table 4 and Table 5 show precision and matrix spike recoveries. If QC recoveries are outside the set limits, the District laboratory usually rejects the analytical batch. If any deficiencies are noted, and the samples have exceeded the required holding times and cannot be re-analyzed, the data are flagged accordingly.

</table>

Recoveries for the QC samples are usually within ±10% from the true value, which is acceptable. The MDL check (QC5), with a true value of 0.004 mg/L, had mean recoveries of 101.8%. The daily MDL check results indicate the laboratory has consistently achieved the established MDL of 0.002 mg/L. An organic check is a solution prepared from phytic acid, which is a stable form of organic phosphate used to prepare matrix spikes, the mean recovery for which was 99.9%.
Inter-Laboratory Quality-Control Assessment

Split Studies with FDEP Laboratory

To assess comparability of results continuously, the District routinely sends split samples to other laboratories. The EVPA Quarterly Splits and the Everglades TP Round Robin (ERR) split-study programs conducted between the FDEP and the District’s laboratory from March 2007 to March 2007 (see Table A-1) provided the data used in this analysis. Figure 5 through Figure 7 show regression analysis of the data and Table 6 shows summary statistics for the data pairs.

**ALL DATA**

Figure 5 shows that the intercept is not statistically different from zero (0) and the slope is not statistically different from one (1) for all TP data from both laboratories. The $r^2$ value is 0.9513. This information shows that the results from the two laboratories have a high degree of agreement (close to 1:1 correlation).

![Regression analysis for TP all data.](image)

Figure 5. Regression analysis for TP all data.

The mean difference (-0.00004 mg/L) and median difference (0.0010 mg/L) were not statistically significant. The observed differences are below the practical quantification level (PQL) of 0.008 mg/L. The paired t-test and signed-rank test yielded p-values of 0.9243 and 0.449, respectively.
**TP ≥ 0.020 mg/L**

Figure 6 shows that the intercept is not statistically different from 0 (zero) and the slope is not statistically different from 1 (one) for samples with TP ≥ 0.020 mg/L. The $r^2$ value is 0.9894. The mean difference (0.0002 mg/L) and median difference (0.0005 mg/L) were not statistically significant. The differences are below the practical quantitation limit (PQL) of the two laboratories. The paired t-test and signed-rank test yielded p-values of 0.7263 and 0.6289 respectively.

![Figure 6. Regression analysis for TP greater or equal to 0.020 mg/L.](image-url)
**TP < 0.020 mg/L**

Figure 7 shows that the slope is not significantly different from 1 (one) and the intercept is not significantly different from 0 (zero) for samples with TP < 0.020 mg/L. The $r^2$ for this regression is 0.5938. At this low level, the data sets do not agree very well, as expected, due to the relatively high variability within each laboratory and between the two laboratories.

![Regression Analysis](image)

**Figure 7.** Regression analysis for TP less than 0.020 mg/L.

At this concentration level (< 0.020 mg/L), the mean difference (-0.0002 mg/L) and median difference (0.0010 mg/L) were not statistically significant. P-values for the paired t-test and signed-rank were 0.743 and 0.8625 respectively.

1 Differences calculated as District TP – FDEP TP. The mean and median differences for all concentration levels are at or below the PQL.

2 Data not used if FDEP value was < 0.004 (FDEP laboratory’s MDL).
National Water Research Institute Environment Canada Ecosystem Inter-laboratory Proficiency Testing Program

The objectives of this program are to assess and demonstrate reliability and quality of analytical measurements of inorganic parameters in natural waters. The results for the District’s laboratory from the most recent study (December 2006/March 2007) are shown in Table 7. The District laboratory was rated on performance of TP as “ideal” (highest category), and the linear regression shows no systematic bias (Figure 8).

Figure 8. Linear regression of reported TP results vs. assigned values.
U.S. Geological Survey (USGS) Analytical Evaluation Program

The District’s laboratory participates in the USGS Study on environmental samples, which is a voluntary inter-laboratory comparison study conducted semiannually. The District Laboratory uses the study to monitor performance. Evaluation of the results is based on the deviation (z-value) from the median and percent difference. Following usual practices, a Z-value < ±2 is considered a satisfactory performance. The District laboratory received a z-value of -0.22 and a percent difference of -4.17 (see Table 8).

Glossary

**Equipment Blank (EB).** A general terminology used for analyte-free water that is processed on-site through all sampling equipment used in routine sample processing. May be an assessment of effectiveness of laboratory decontamination or on-site (field) decontamination (FCEB).

**Field Cleaned Equipment Blank (FCEB).** Analyte-free water that is processed on-site, after the first sampling site, through all sampling equipment used in routine sample processing. EB values are indicative of the effectiveness of the decontamination process.

**Field Blank (FB).** Analyte-free water that is poured directly into the sample container on site during routine collection, preserved and kept open until sample collection is completed for the routine sample at that site. FB values are indicative of environmental contamination on site.

**Split Sample (SS).** A second sample collected from the same sample obtained from the same sampling device. Results for SS are compared with routine sample results; agreement between these two results is mostly an indication of laboratory precision.

**Replicate Sample (RS).** A second sample collected from the same source as the routine sample, using the same sampling equipment. RS data are compared to routine sample to evaluate sampling precision.

**Precision.** The agreement or closeness between two or more results and is an indication that the measurement system is operating consistently and is a quantifiable indication of variations introduced by the analytical systems over a given time and field sampling period.

**Accuracy.** The agreement between the actual obtained result and the expected result. QC-check samples, having known or “true” values, are used to test for the accuracy of a measurement system.

**Method Detection Limit (MDL).** The smallest concentration of an analyte of interest that can be measured and reported with 99 percent confidence that the concentration is greater than zero. The MDLs are determined from the analysis of a sample in a given matrix, using accepted sampling and analytical preparation procedures, containing the analyte at a specified level. The MDL is determined by the protocol defined in section 40 CFR Part 136, Appendix B as established by the EPA.

**Practical Quantitation Limit (PQL).** The smallest concentration of an analyte of interest that can be quantitatively reported with a specific degree of confidence. Generally, the PQL is 12 times the standard deviation that is derived from the procedure used to determine the MDL, or can be assumed to be 4 times the MDL.

**Relative Standard Deviation (RSD).** A measurement of precision, used when comparing more than two results. It is calculated as %RSD = [Std. Deviation/Mean]*100

**Relative Percent Difference (RPD).** A measure of precision, used when comparing two values. It is calculated as %RPD = [Value1-Value2]/Mean * 100.

**Z-Value.** A measure of the deviation of the result (Xi) from the assigned value (X) for that determinant (calculated as \( z = (Xi – X)/\sigma \) where \( \sigma \) is a standard deviation) (EURACHEM).
