

June 3, 2003

**REQUEST FOR MODIFICATION OF WATER QUALITY  
MONITORING REQUIREMENTS FOR FDEP PERMIT  
NUMBER 06, 502590709 (NON-ECP PERMIT)**

Parameter	Requested Modification	Justification
Physical Parameters; Nutrients	Change monitoring frequency from Biweekly When Flowing or otherwise Monthly with no flow (BWF/M), to Biweekly When Flowing. Sampling is to restart after flow events commence.	Samples collected under no-flow conditions provide little or no additional useful information about water quality entering the Everglades Protection Area
All parameters	Discontinue monitoring at S-14 (INTO) structure and G-69 (WITHIN) structure. Sampling will recommence if the structures are reopened.	Structures are closed and no flow has occurred from Oct. 1, 1998 to Apr 30, 2002
All Parameters	Monitor only Biweekly When Flowing at S332	Levee at S332 has been degraded; structure will only discharge during emergency conditions
Pesticides	Discontinue monitoring at S332	Levee at S332 has been degraded; structure will only discharge during emergency conditions
Pesticides	Discontinue monitoring for Zinc Phosphide at S190	Zinc Phosphide has not been detected at S190 since January 1999 when monitoring began.

## Backup documentation for requested minor modifications to the Non-ECP Permit monitoring requirements.

1. ***Change monitoring frequency from Biweekly When Flowing or otherwise Monthly with no flow (BWF/M), to Biweekly When Flowing. Sampling is to restart after flow events commence.***

The purpose of the non-ECP monitoring program is to assess the quality of the water flowing into, within and from the Everglades Protection Area (EPA) so that parameter loads and concentrations can be determined. When no flow is occurring, the water at the sampling points can become stagnant and display significant variations in water quality. Sampling during periods of no flow does not add information about the concentrations or loads of various parameters in the EPA and may actually present a false picture of average concentrations at the sample points.

The accompanying charts indicate the characteristics of the nutrient water quality data collected and analyzed over the last three years for each sample point covered by the Non-ECP permit. For each sample point, average, maximum and minimum concentrations are shown, accompanied by the standard deviations of the data and the number of samples analyzed during the period, broken down by flow and non-flow sampling events. These data indicate that, in general and with notable exceptions, average concentrations for flow and non-flow sampling periods are roughly similar, but the range of concentrations and the standard deviations of the data are significantly different for non-flow events for some of the parameters at some sampling locations. This may be due to stagnation of the water at the sample points during no flow periods causing changes in the nutrient content of the water. In addition, the number of non-flow sampling events is greater than the number of flow sampling events for some sample points. Use of concentration data for these sample points that are not corrected for flow conditions may therefore result in erroneous conclusions concerning nutrient transport in the EPA.

**2. Discontinue monitoring all parameters at S-14 (INTO) structure and G-69 (WITHIN) structure. Sampling will recommence if the structures are reopened.**

Both of these structures are currently closed and are not being operated. The attached chart indicates that there is no measurable flow through S-14.

The chart below indicates very small flows through the G-69 C structure after Sept. 1, 2000. These flows are considered to be artifacts of a possibly incorrectly calibrated flow measurement system. The Operations Department of the District has confirmed that this structure is closed and has not been operated during the period of record. Additional field observations have indicated that there may be low quantities of flow through the structure due to leakage through the closed gates or a gate that has been partially opened by outside parties.

### ***3. Monitor all parameters at S332 Biweekly only When Flowing.***

The levee North of S332 has been degraded. Water is free to flow around and seep under the structure under normal operating conditions. The structure will only be operated under emergency conditions when additional capacity is required for flood control due to extreme weather events. Should the structure be operated, regular monitoring will commence when operations start, and will continue biweekly as long as there is flow through the structure.

### ***4. Discontinue all pesticide monitoring at S332.***

Pesticide monitoring will be discontinued at the structure because the levee is degraded and the structure is no longer being operated.

### ***5. Discontinue monitoring for Zinc Phosphide at S190.***

For the entire period of record in the SFWMD water quality database, Zinc Phosphide has never been detected at S190 for as long as it has been monitored dating from July 1987.

## **Future Considerations**

### ***Eliminate monitoring for trace metals from all INTO stations***

Monitoring has previously been eliminated for all WITHIN and FROM structures in the previous minor modification to the Non-ECP Permit. For all analyses charted below, laboratory results have been plotted to show the comparison with Class III water quality standards for the metal in question. The values for the standard vary because the standards are tied to the hardness concentration which varies widely in the analyzed samples. For all analyses below the detection limit, the value shown on the charts reflects 100% of the detection limit, giving the most conservative interpretation of the data. The charts were compiled so that the types of structures are grouped together; in other words, all INTO structures are shown on one plot, all C-111 structures are shown on another, etc. Even though monitoring is continuing under the conditions of the permit only for INTO structures, all available values for all Non-ECP structures are shown as background data.

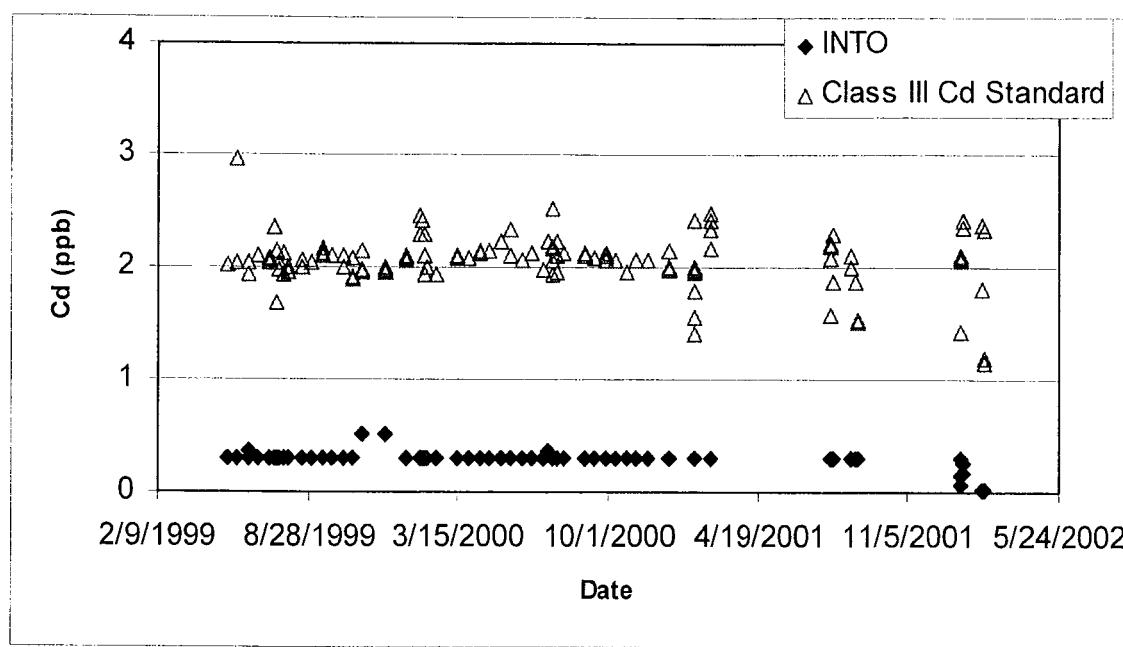

PLEASE NOTE: mercury monitoring is not a part of the Non-ECP Permit so any reduction of monitoring for the permit will not affect any mercury monitoring programs.
